

DesiRNA:

Application to EteRNA benchmark, bacterial and viral structures

RNA 2D structure prediction

Given a target sequence, predict its 2D structure

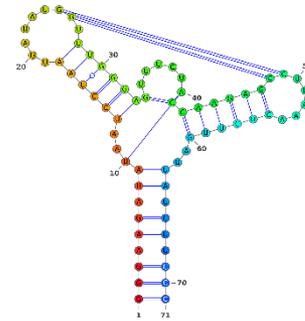

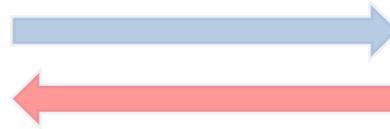

GGGAAGAUUAAUCCUAA
UGAUAUGGUUUGGGAGUU
UCUACCAAGAGCCUAAA
CUCUUGAUUAUCUCC

RNA 2D sequence design

Given target 2D structure, predict a sequence that folds to form that structure

GGGAAGAUUAAUCCUAA
UGAUUAUGGUUUGGGAGUU
UCUACCAAGAGCCUAAA
CUCUUGAUUAUCUCC

RNA Design – brute force?

Brute force approach – $4^u \cdot 6^{p/2}$ for an RNA having u unpaired and p paired residues ...

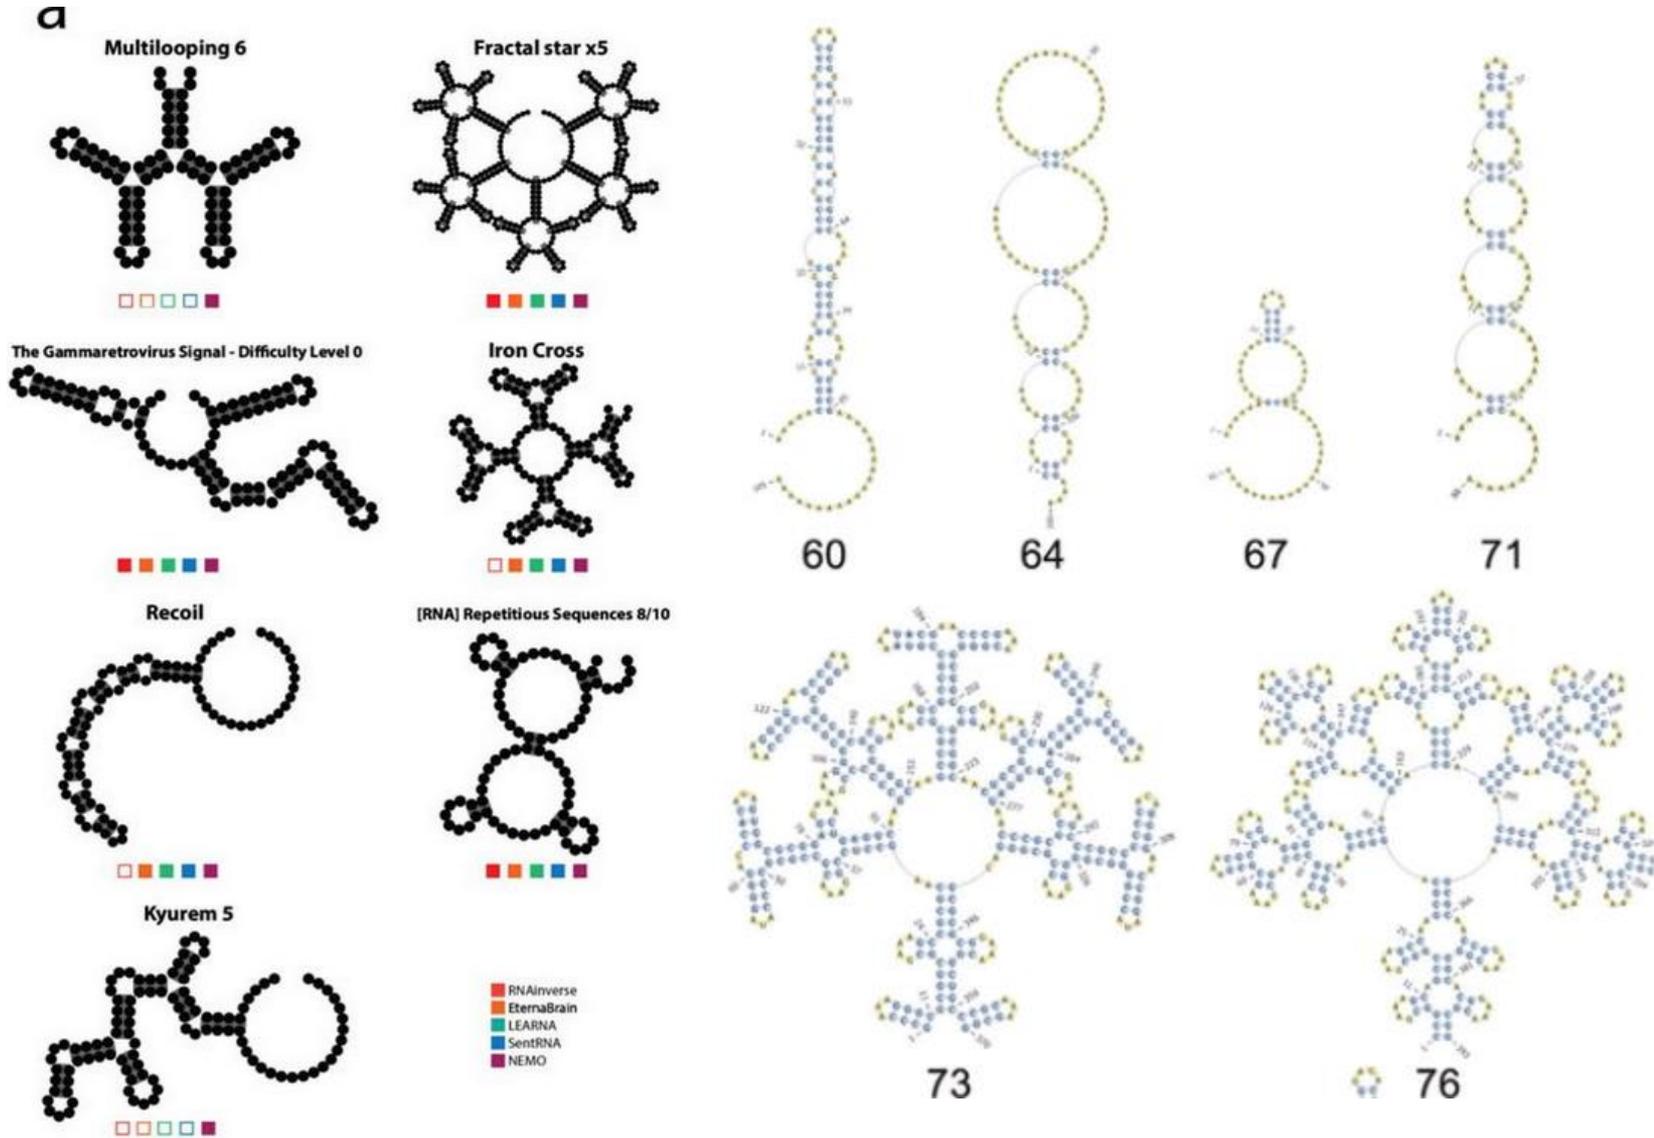

((.....)) $nt = 10, u = 6, p = 4$

No. of possible sequences = **147456**

(((((...((.....))...)))))) $nt = 22, u = 10, p = 12$

No. of possible sequences = **4.98^{10} !!!**

EteRNA benchmark

RNA Design – existing methods - limitations

- No pseudoknots
- No multimer design
- Not checking for oligomerization
- No temperature dependency
- No alternative structures
- No „natural” sequences

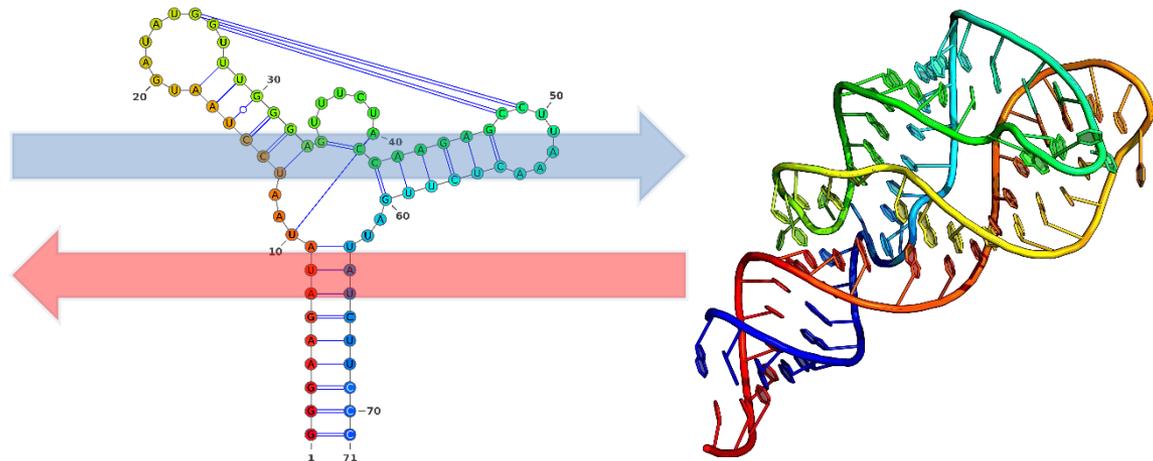

DesiRNA – 2D design

DesiRNA – algorithm for secondary structure design

- use both positive and negative design
- an algorithm which maximizes the appearance of the target secondary structure in the thermodynamic ensemble
- consider oligomerization (monomers vs homooligomers)
- designs alternative structures

DEFIRNA

Monte Carlo

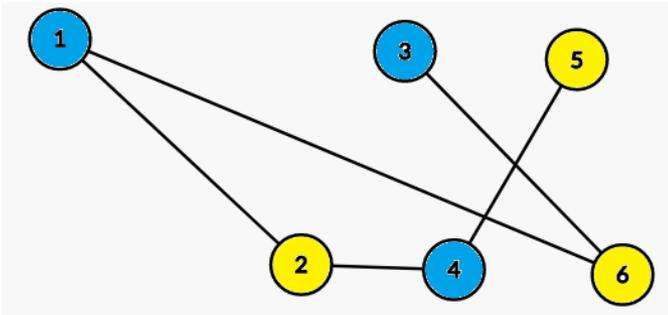

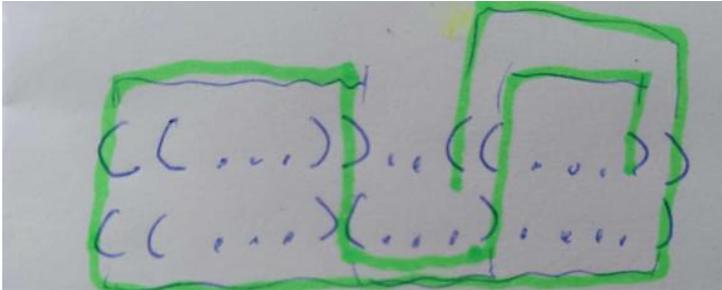

Replica Exchange

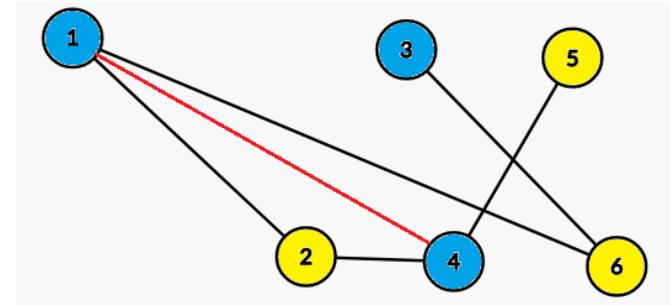

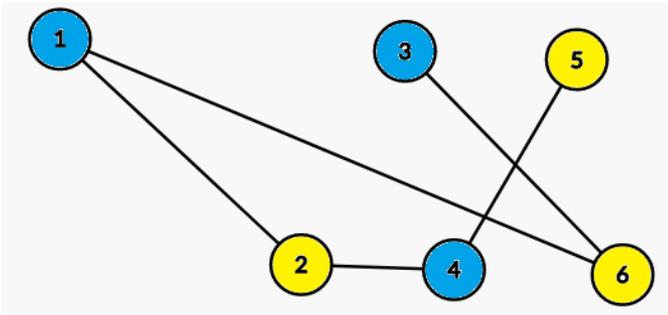

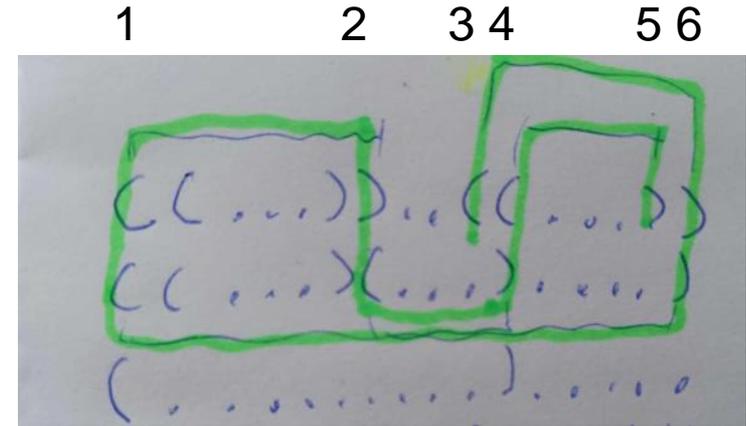

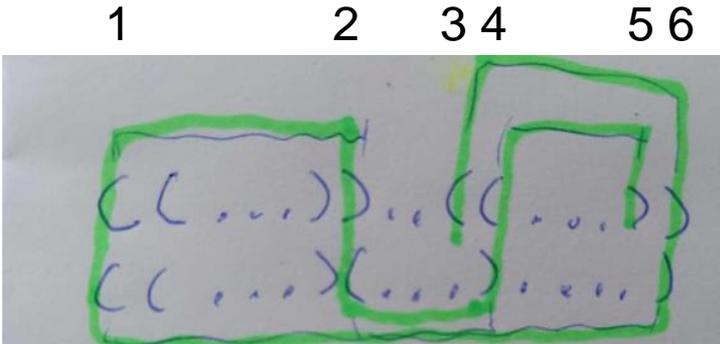

Alternative structures– graph coloring

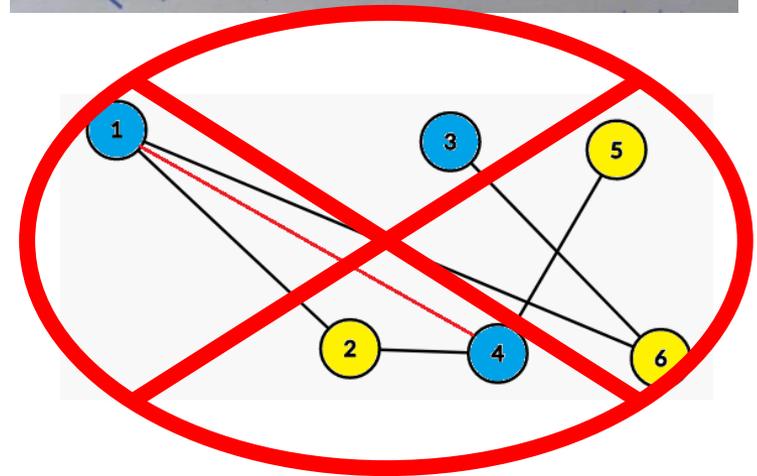

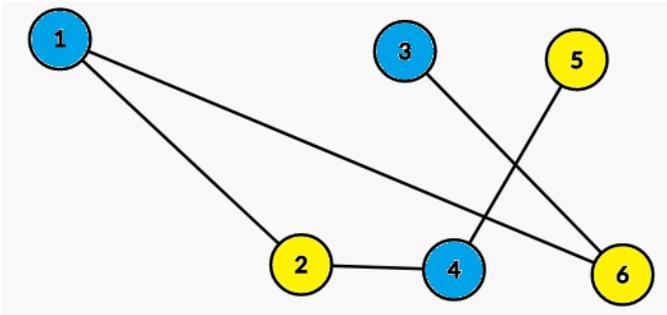

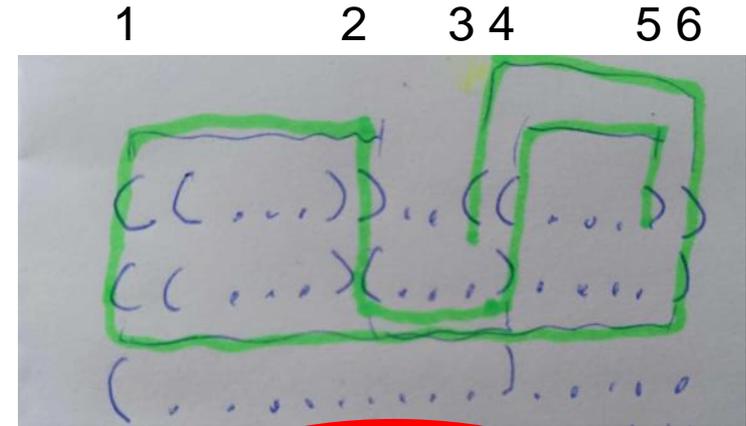

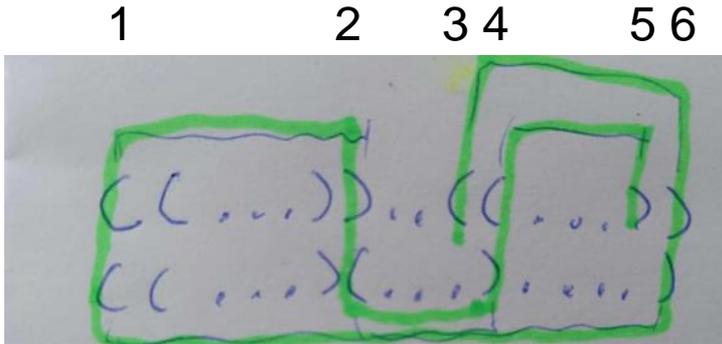

1 2 3 4 5 6

Alternative structures– graph coloring

Alternative structures– graph coloring

In alternative structures sequence design the graphs have to be „bipartite” (node of one color can be only connected to nodes of the second color)

DesiRNA – scoring functions

Ed-Epf: Energy of the desired structure (E_d) minus free energy of the thermodynamic ensemble (E_{pf})

$$s = \exp\left[\frac{1}{kT} \times E_d - E_{pf}\right]$$

- Ed-MFE: Energy of the desired structure (E_d) minus Minimum Free Energy (MFE)
- 1-MCC: One minus Matthews Correlation Coefficient (MCC).
- sln_Epf : Sequence Length Normalized Epf.
- 1-precision: One minus precision ($TP/(TP+FP)$).
- 1-recall: One minus recall ($TP/(TP+FN)$).
- Edef: deviation of the RNA secondary structure ensemble from the target structure, normalized by sequence length

DesiRNA

- Design single chain RNA
- Design multimeric RNA
- Various types of constraints:

- Structure

(((((((.(((((((...)).)))))))))))))

- Sequence

GAUUANNNNAAGCAGUNNNNUCCANNNNN

- Alternative structures

(((((((.(((((((...)).)))))))))))))
(((((((...))((((.....))))))))))

- Pseudoknots

((((([.(((((([].)).)))))).))))))

- Oligomerization

- Homo/ Heterodimers

- Prevented patterns

AAAA, GNRA, GGGC

- ACGU%

- **BONUS: It is extremely fast and lightweight!**

README Apache-2.0 license

DesiRNA

DesiRNA is a state-of-the-art RNA sequence design tool, that stands out for its speed, lightweight nature, ease of installation, and user-friendly interface.

python 3.6 Python tested 3.9.x | 3.8.x | 3.7.x | 3.6.x build passing

repo status Active last commit march License Apache 2.0

installable via Conda

Features

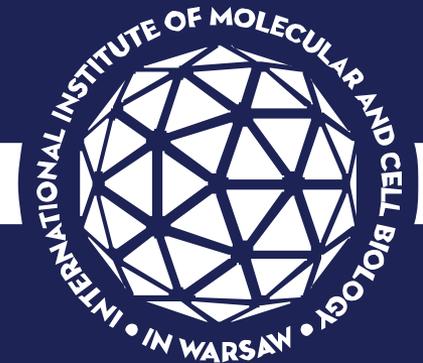

- **Super Fast:** Utilizes Replica Exchange Monte Carlo for efficient computations.
- **Installation:** Simple to install and requires only Python3.
- **Versatile Design Capabilities:**

Conclusions

- DesiRNA works like a charm
- The only method that solves the whole Eterna benchmark
- Extremely fast and lightweight
- User-friendly, easy to install
- Good documentation
- Alternative structures design, negative design, homodimer/monomer design – and more!

Thank you!
