March 2025

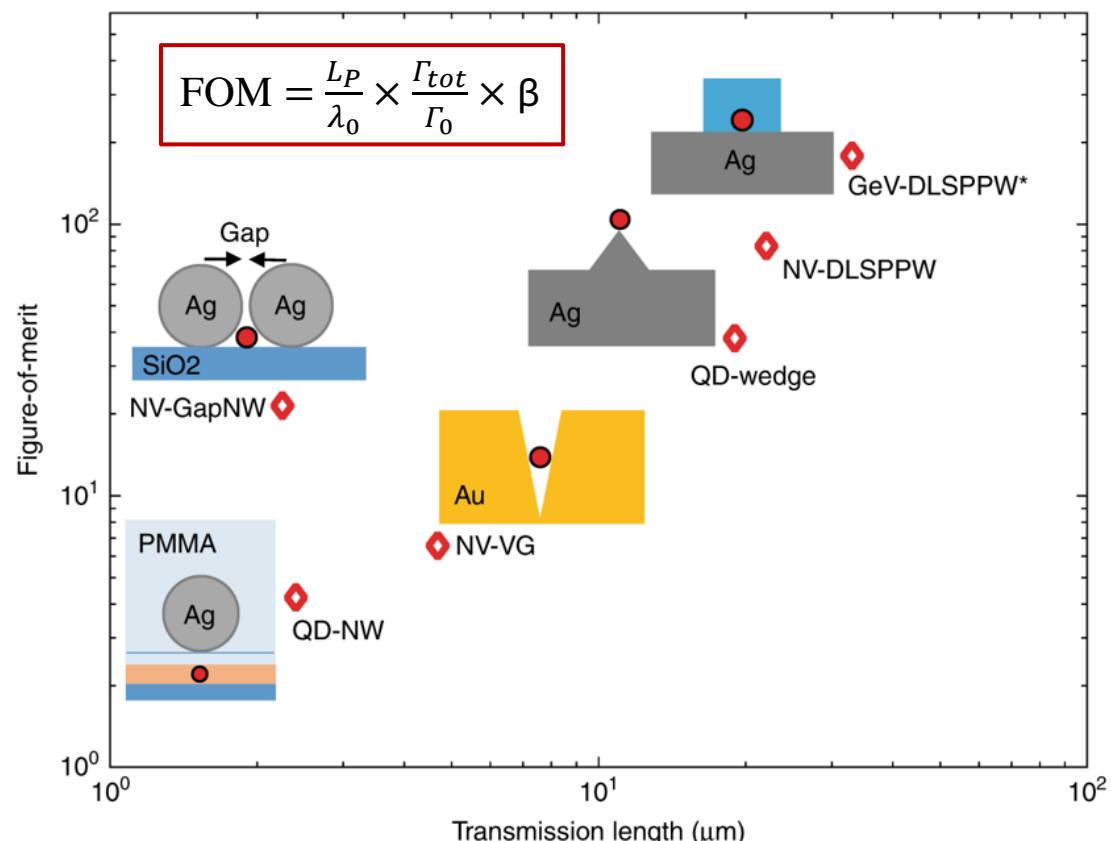

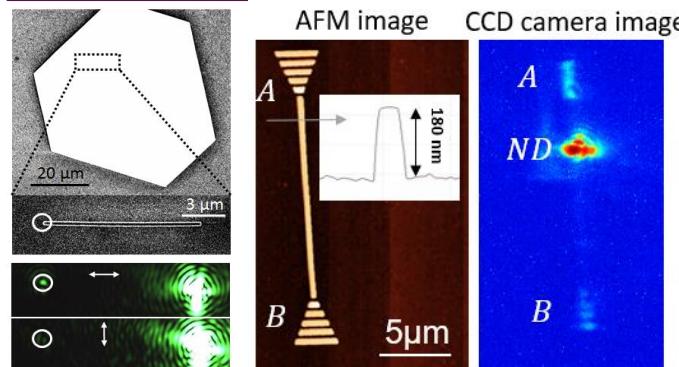

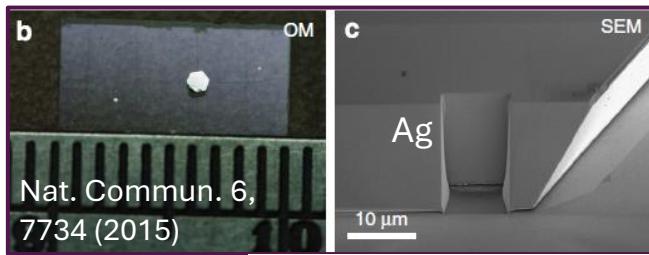

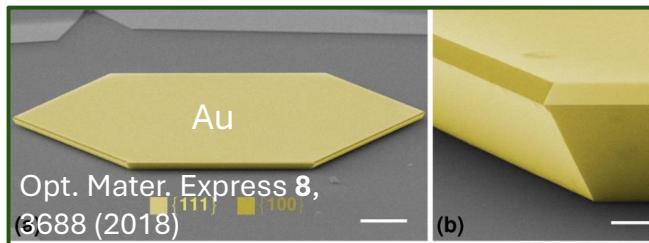

# Emitter-waveguide coupling systems

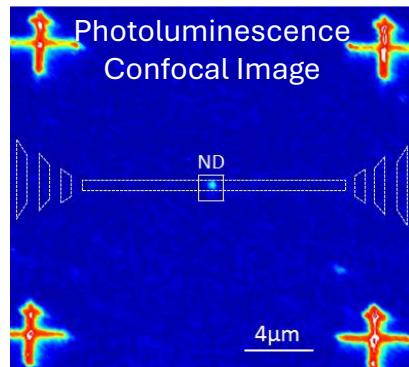

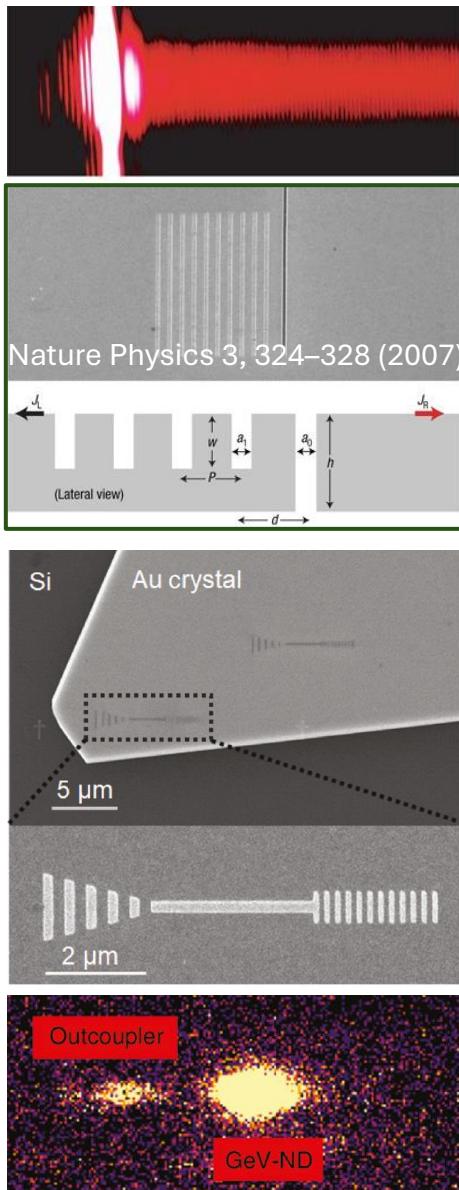

Nature 450, 402–406 (2007)

**Figure-of-merit:** The ability to efficiently deliver single photons in an emitter-waveguide system.

- Confined slow-light mode (high Purcell factor,  $\frac{\Gamma_{tot}}{\Gamma_0}$ )
- Moderate losses (large propagation length  $L_P$ )
- High emitter-waveguide coupling efficiency ( $\beta = \frac{\Gamma_{wg}}{\Gamma_{tot}}$ )

# Directional coupling

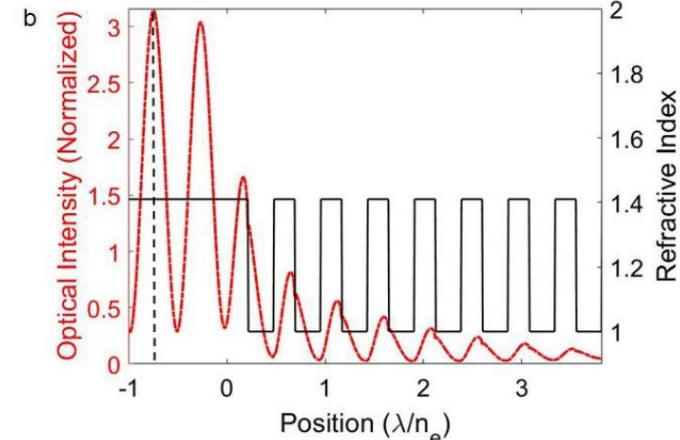

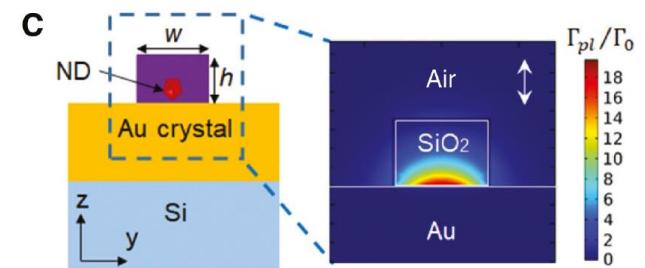

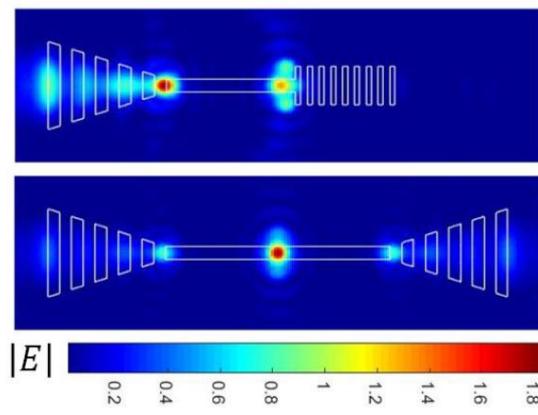

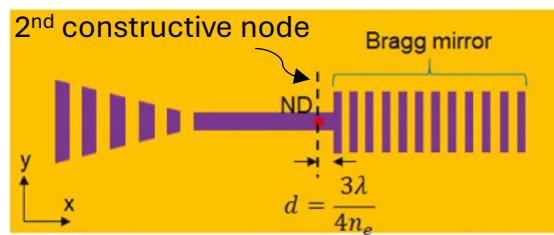

**Figure-of-merit:** The ability to achieve directional transmission of single photons.

- High Purcell factor ( $\frac{\Gamma_{tot}}{\Gamma_0}$ )
- Greater propagation length ( $L_P$ )
- High directional coupling efficiency ( $\beta_d$ )

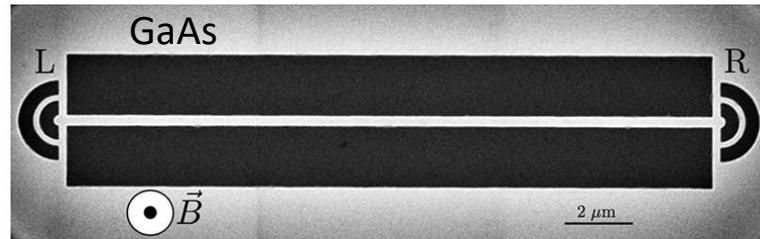

$$\text{FOM} = \frac{L_P}{\lambda_0} \times \frac{\Gamma_{tot}}{\Gamma_0} \times \beta_d$$

- ✗  $\beta$ -factor is limited (<70%)
- ✗ Limited scalability

# Propagation-direction-dependent (chiral) coupling

- Chiral effects induced by nanoscale confinement of guided modes

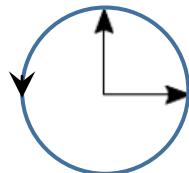

A typical nanobeam waveguide

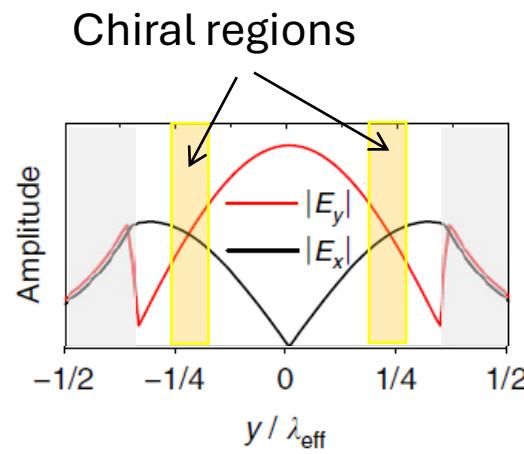

$$\vec{E} = \begin{pmatrix} E_x \\ E_y \\ 0 \end{pmatrix} e^{ikx}$$

TE mode propagating  
in  $+x$  direction

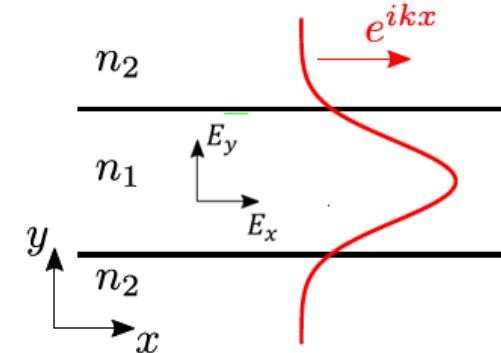

$$E_x \approx -iE_y$$

Circularly polarized  
light field

✗ Limited  $\beta$  and Purcell factor

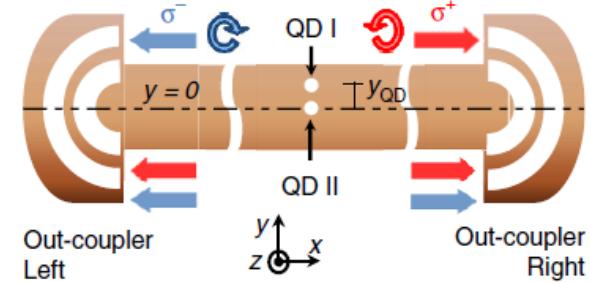

$$E_x = \frac{i}{k} \frac{\partial E_y}{\partial y}$$

$E_x$  and  $E_y$  oscillate 90° out of phase

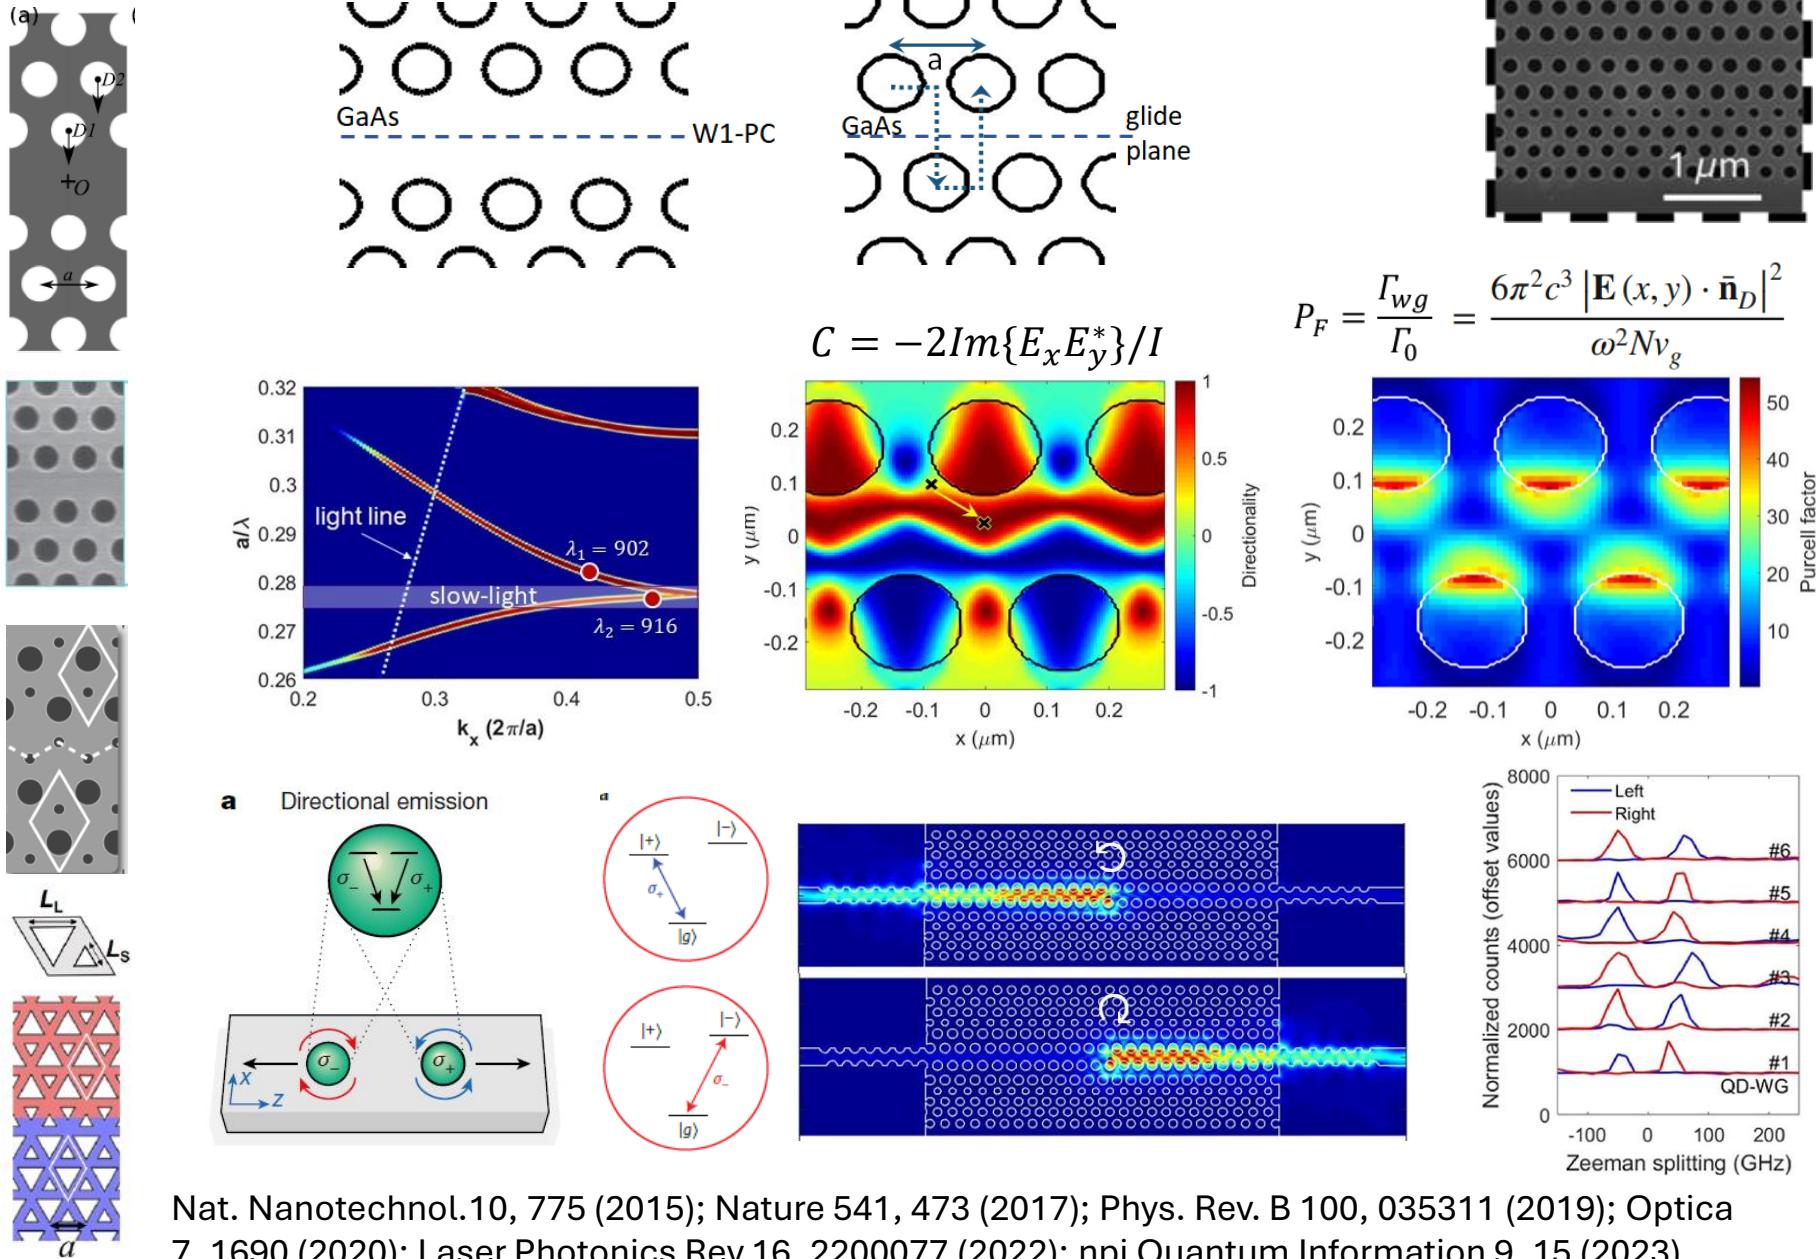

Magnitude is related to the mode confinement

Spin-momentum locking of light

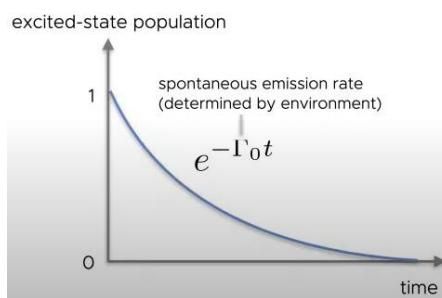

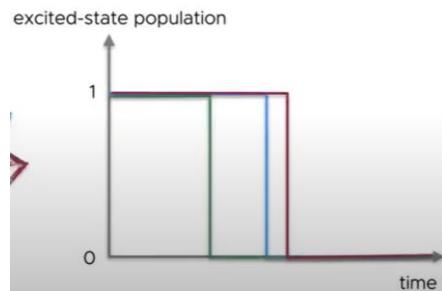

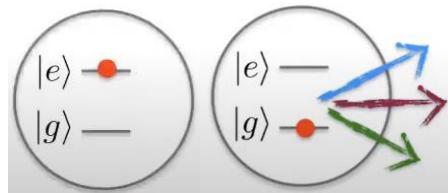

Coles et al., Nat. Commun. 7, 11183 (2016)

# Engineering chiral interactions in waveguides

# Purcell enhancement in the slow-light regime

$$\frac{\text{Purcell factor}}{\Gamma_{wg}} \propto \frac{n_g}{\Gamma_0} \frac{A_{wg}}{\text{mode area}}$$

group index

Non-Resonant  $|f\rangle$

Quasi-Resonant  $|X\rangle$

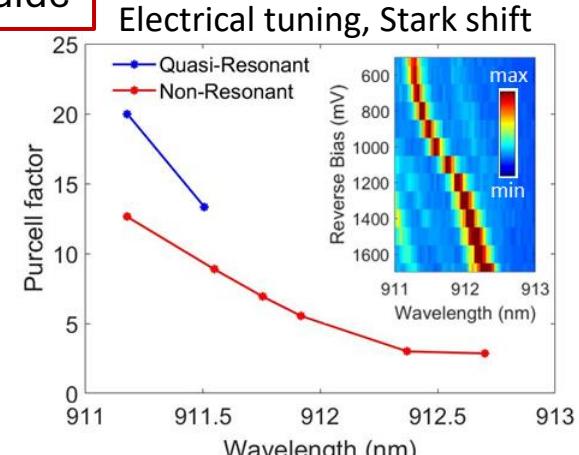

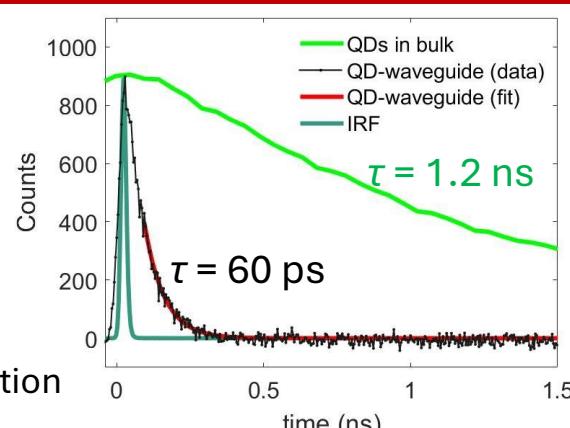

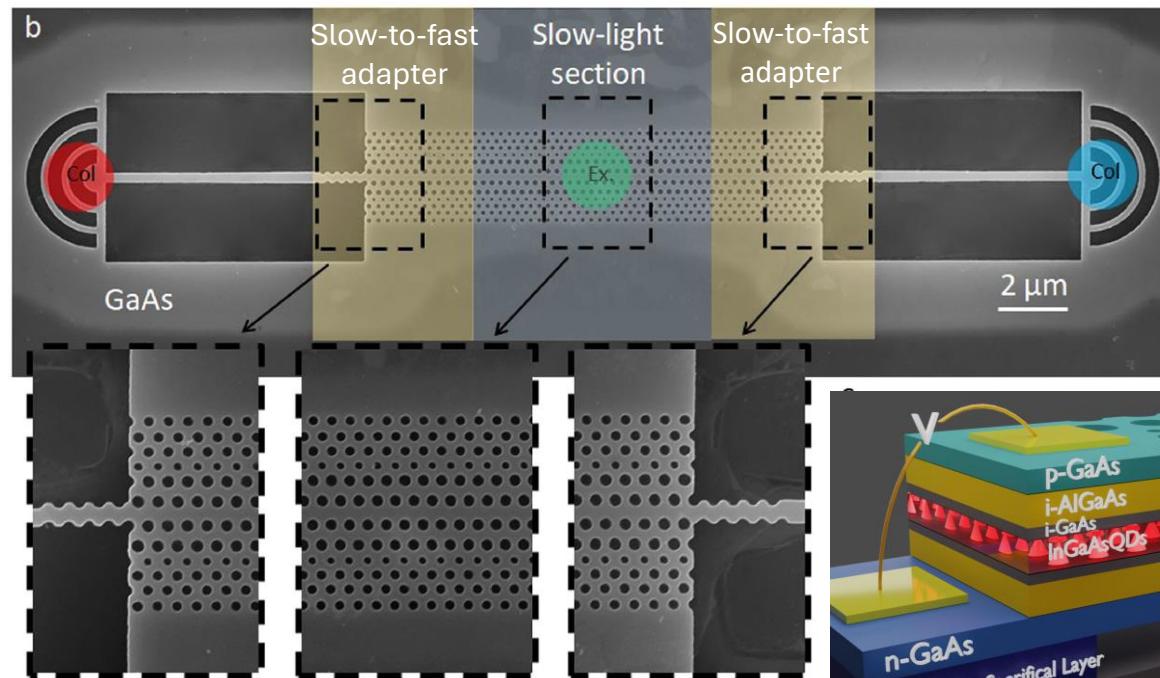

$808 \text{ nm}$

$\Gamma_{nr}$

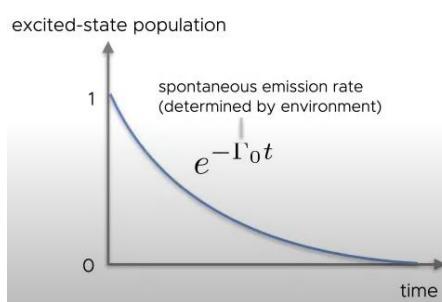

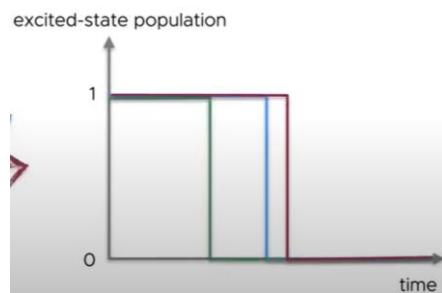

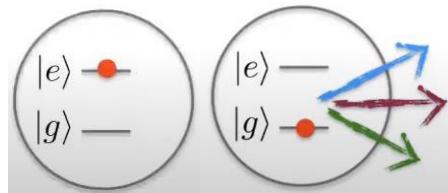

$\Gamma_r$

$|0\rangle$

To eliminate intradot relaxation

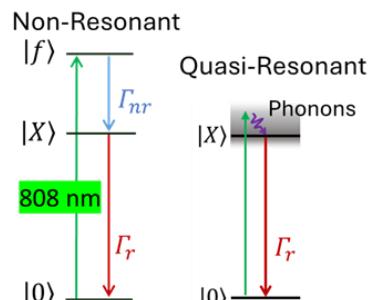

# Purcell enhancement in the slow-light regime

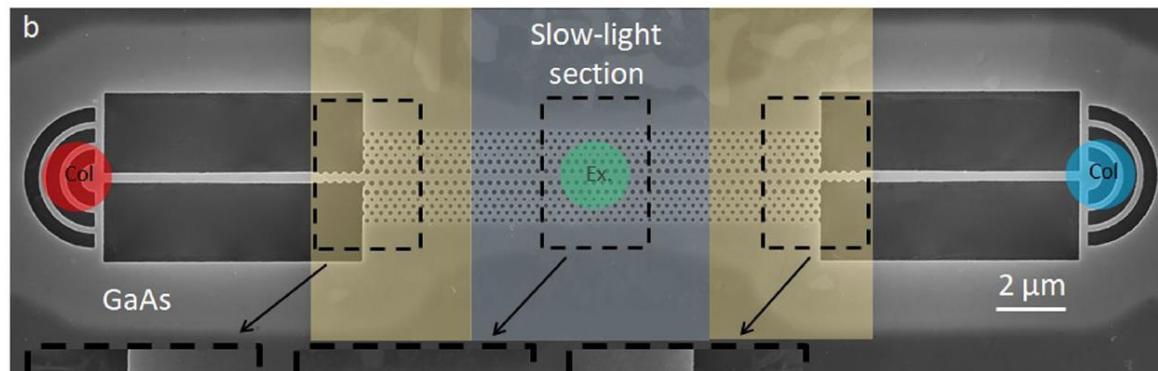

$$\frac{\text{Purcell factor}}{\Gamma_{wg}} \propto \frac{n_g}{A_{wg}}$$

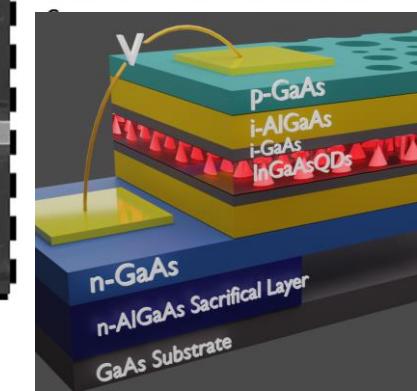

group index  
mode area

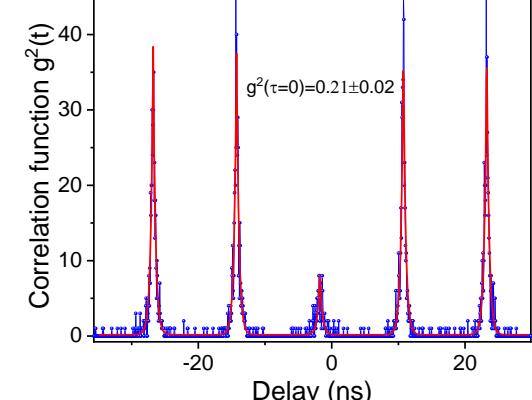

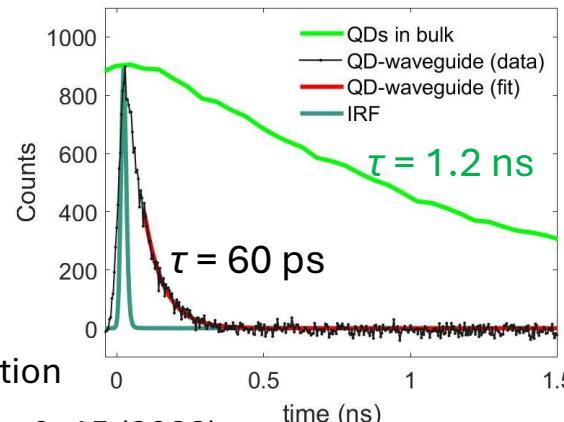

To eliminate intradot relaxation

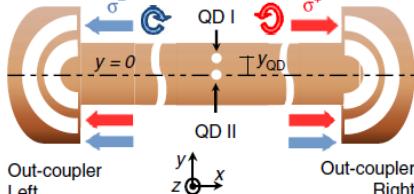

✓ A record Purcell factor of 20-fold and near-unity  $\beta$  in chiral waveguide

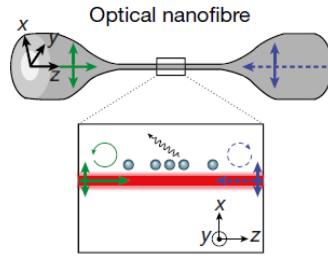

✓ Single photon emitter

**Figure-of-merit:** The ability to achieve efficient directional coupling of spin-carrying photons.

- Large chiral area (scalability)
- High Purcell within the chiral area
- High coupling efficiency ( $\beta$ )

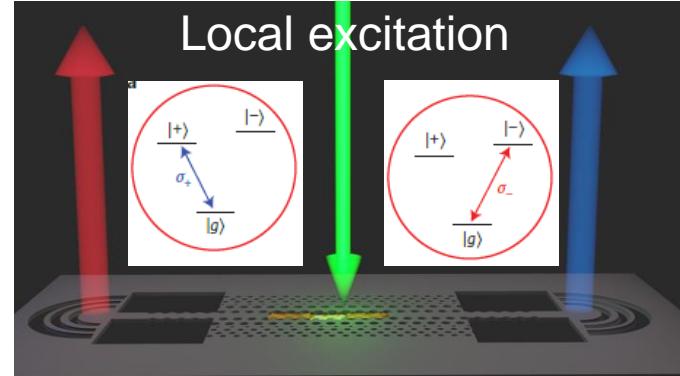

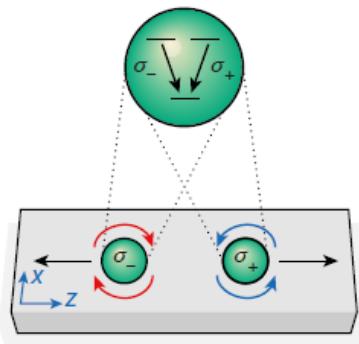

$$\text{FOM} = A_{\text{chiral}} \cdot \frac{\Gamma_{\text{tot}}}{\Gamma_0} \cdot \beta$$

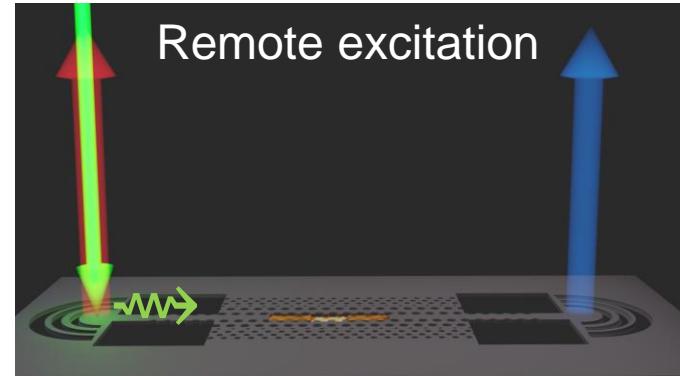

Waveguide device	Chiral area	$\beta$ -factor	Purcell factor	FOM
NB	28%	83%	1.1	0.31
W1	0.8%	99%	2.8	0.02
GPN	28%	83%	2.2	0.61
GPW	36%	99%	30	10.8
Topological Valley-Hall	21%	57%	0.68	0.14

# Summary and outlook

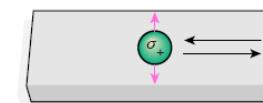

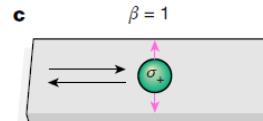

**Cooperativity:**

$$C = \frac{\beta}{1 - \beta}$$

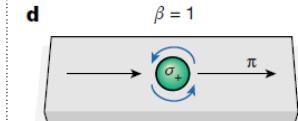

key ingredient  
to scale up  
the system

**Symmetric (Isotropic)**

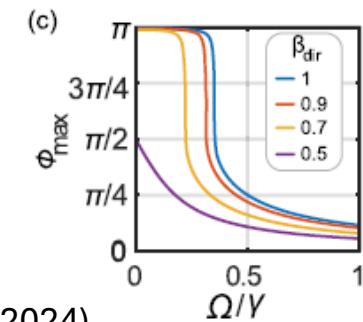

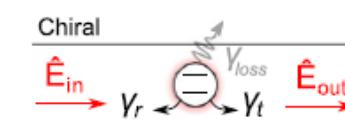

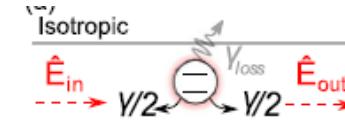

**Chiral**

**Direction-Dependent Phase Shift:**

- Chiral coupling transforms a perfectly reflecting emitter into a fully transparent one, inducing a non-reciprocal  $\pi$  phase shift in the light.
