finite group

Consequences of MPU symmetry for MPS

↳ System of defect tensors

↳ Gauging procedure (Global sym. $\xrightarrow{\text{add d.o.f.}}$ Local sym.)

Gauged tensor

$$\begin{array}{c} | \\ - \end{array} = \sum_g \begin{array}{c} | \\ - \\ g \end{array} \otimes |g\rangle$$

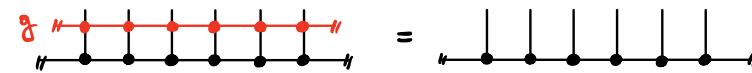

Locally invariant wavefunction

$$g_g \begin{array}{c} | \\ - \end{array} = \begin{array}{c} | \\ - \\ g \end{array}$$

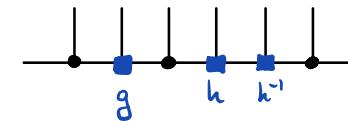

Motivation: entanglement struct. of SPTs, gauge theories, mapping btw. phases

Outline

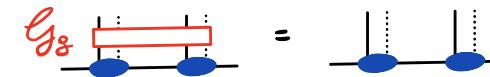

I. Preliminaries

II. Defect systems

III. Gauging

Outline

I. Preliminaries

$$\delta \text{ } \# \text{---} \bullet \text{---} \bullet \text{---} \bullet \text{---} \bullet \text{---} \bullet \text{---} \bullet \text{---} \# = \# \text{---} \bullet \text{---} \bullet \text{---} \bullet \text{---} \bullet \text{---} \bullet \text{---} \bullet \text{---} \#$$

II. Defect systems

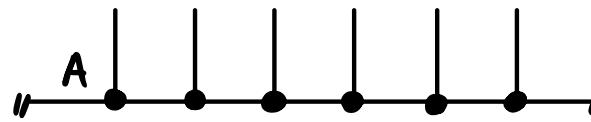

$$\# \text{---} \bullet \text{---} \bullet \text{---} \bullet \text{---} \bullet \text{---} \#$$

g h h^{-1}

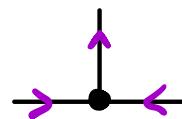

III. Gauging

$$g_\delta \text{---} \bullet \text{---} \bullet \text{---} \# = \text{---} \bullet \text{---} \bullet \text{---} \#$$

Matrix Product States

Injective

(basic building block)

$$\begin{array}{c} A^{-1} \\ \hline \textcolor{violet}{\bullet} \\ \hline A \end{array} = \boxed{\quad} \boxed{\quad}$$

(think u.g.g.s.)

Block-injective

$$A^i \sim \left(\begin{array}{c} \square \\ \square \\ \square \\ \square \end{array} \right) \text{ injective blocks}$$

(think SSB)

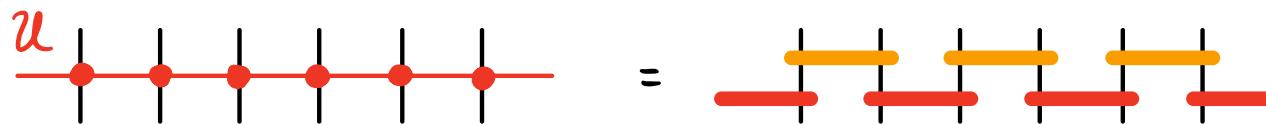

example: GHZ state $|000\dots 0\rangle + |111\dots 1\rangle$

$$\begin{array}{c} | \\ | \\ | \\ | \\ \hline \end{array} = \begin{array}{ccccccccc} \circ & \circ \end{array} + \begin{array}{ccccccccc} \bullet & \bullet \end{array}$$

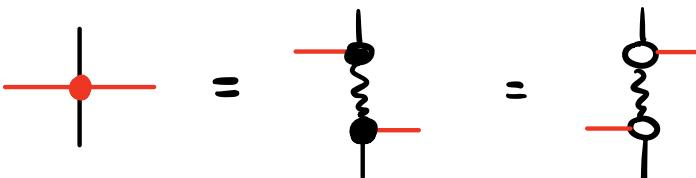

$D=2$ $D=1$ $D=1$

Matrix Product Unitaries

[Cirac et al. '17]
[Chen, Liu, Wen '11]

→ Two-layer circuit decomposition

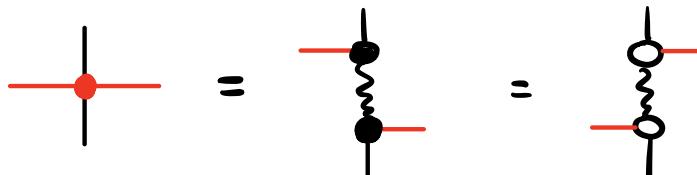

(for simple MPU, reach by blocking)

Matrix Product Unitaries

[Cirac et al. '17]
 [Chen, Liu, Wen '11]

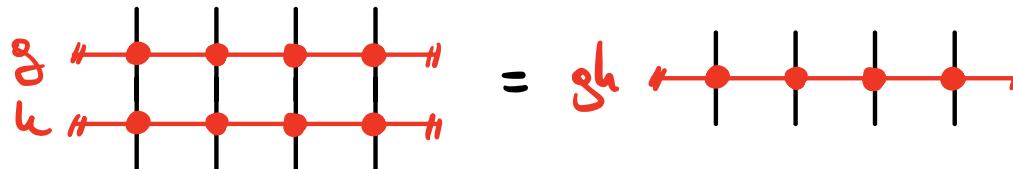

→ Two-layer circuit decomposition

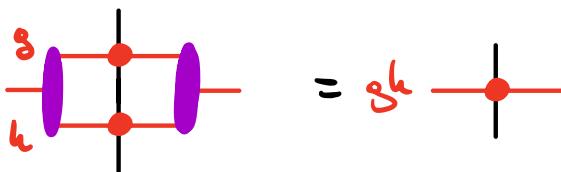

(for simple MP U , reach by blocking)

→ Group representation

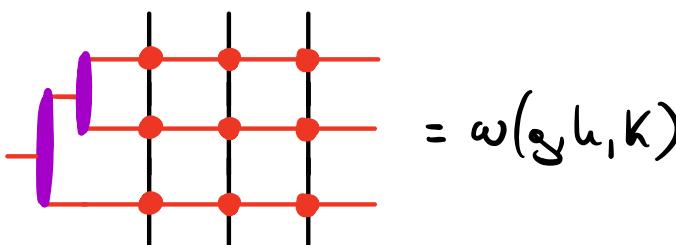

Fusion tensors

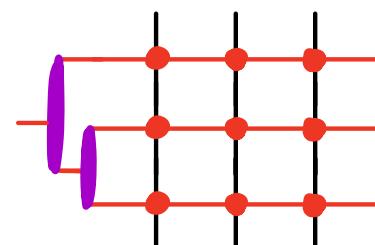

(defined up to scalar)

3-cocycle

$$= \omega(g, h, k)$$

$$[\omega] \in H^3(G, U(1))$$

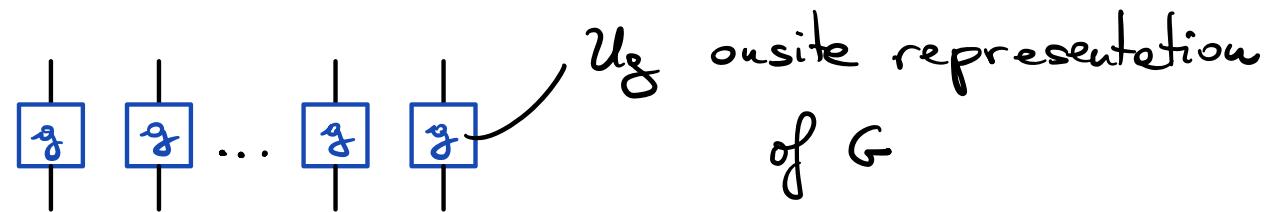

$$[\omega] \neq 1 \Rightarrow$$

⇒ anomaly

Examples of M_{PU}

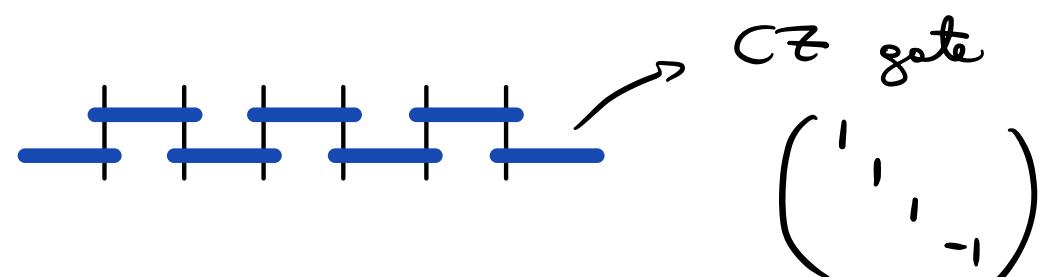

1.) Onsite $D=1$

non anomalous

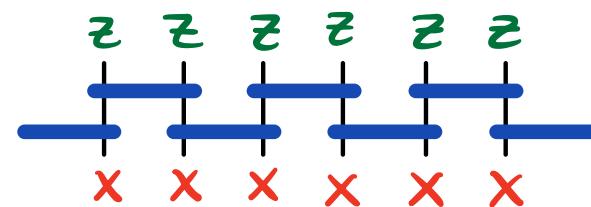

2.) CZ M_{PU} (\mathbb{Z}_2)

non anomalous

3.) CZX (\mathbb{Z}_2)

anomalous!

↓
no injective invariant MPS (GHZ invariant, blocks permuted)

MPU acting on MPS

[Gorre-Rubio, Lootens, Molnár '22]

$$G \circ X = \{ \times \} \text{ (injective blocks)}$$

Action tensors

$$\begin{array}{c} g \\ | \\ \text{---} \\ | \\ x \end{array} = \begin{array}{c} | \\ \text{---} \\ | \\ g \cdot x \end{array}$$

(defined up to scalar)

MPU acting on MPS

[Gorre-Rubio, Lootens, Molnár '22]

$$G \otimes X = \{ \times \} \text{ (injective blocks)}$$

Action tensors

$$\begin{array}{c} g \\ | \\ \text{---} \\ | \\ \text{---} \end{array} \quad = \quad \begin{array}{c} | \\ \text{---} \\ | \\ \text{---} \end{array} \quad g \cdot x$$

(defined up to scalar)

L -symbols

$$\begin{array}{c} | \\ | \\ | \\ | \\ \text{---} \end{array} \quad = \quad L_{g,h}^x$$

$$\begin{array}{c} | \\ | \\ | \\ | \\ \text{---} \end{array}$$

related to ω

$$L_{g,h}^x L_{h,k}^x = \omega(g, h, k) L_{g,h}^{K \cdot x} L_{gh,k}^x$$

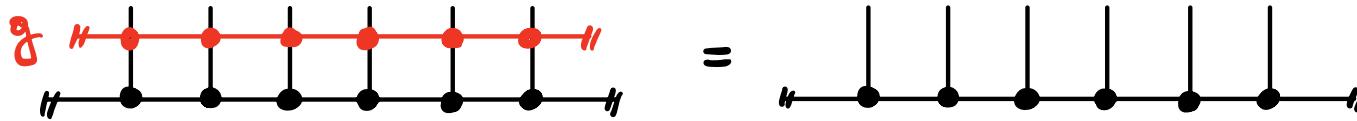

$$L = 1 ? \quad (\Rightarrow \omega = 1)$$

↳ "Block independence"

(in the injective case $L_{g,h}^x \equiv L_{g,h}$)

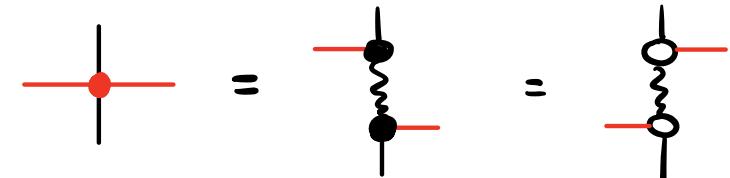

$$\xrightarrow{\text{absorb in}} = 1$$

Takeaways

1. We'll consider injective and noninjective invariant MPS.
(u.ggs.) (SSB)

2. MPU tensors have nice splittings

3. MPU group rep's come with some tensors
and scalars

$$\omega(g, h, k)$$

4. MPU-inv. MPS come with some tensors
and scalars

$$L_{g,k}^*$$

info

Outline

I. Preliminaries

$$\delta \text{ } \# = \text{ } \# \text{ } \#$$

II. Defect systems

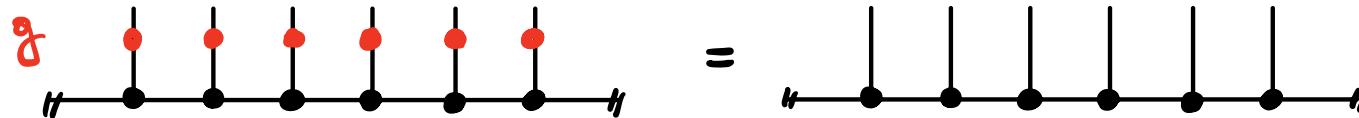

III. Gauging

$$g_8 \text{ } \# \text{ } \# \text{ } \# \text{ } \# = \text{ } \# \text{ } \# \text{ } \# \text{ } \#$$

Refresher : Onsite case ($D=1$)

Injective invariant MPS

Virtual symmetry representation

$$u_g \circ = X_g^+ X_g$$

($g \rightarrow X_g$ may be projective)

$$X_g X_h = \mathcal{U}(g, h) X_{gh}$$

pair creation

Symmetry defects / twists

$$X_g u_g = X_g$$

movement

$$u_g X_h = X_{gh}$$

fusion

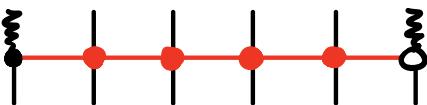

by local unitaries

$$X_g X_h = X_{gh}$$

MPU defects (injective case)

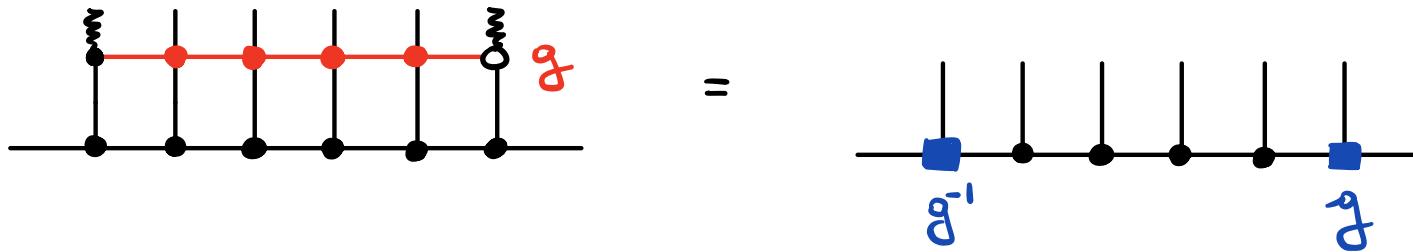

Need a spatial truncation of the symmetry

$$U_L^g \equiv$$

$$\left(\begin{array}{c} \text{recall} \\ \text{---} \bullet = \text{---} \bullet = \text{---} \circ \end{array} \right)$$

This time, defects sit on sites

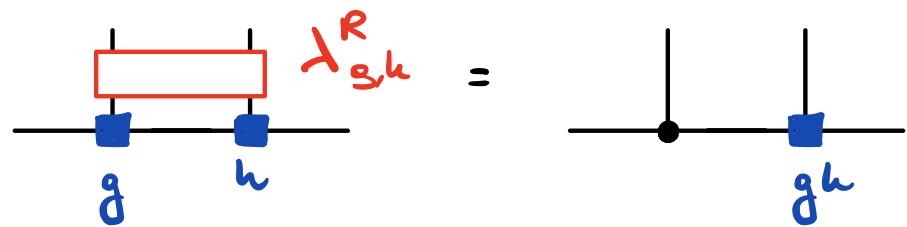

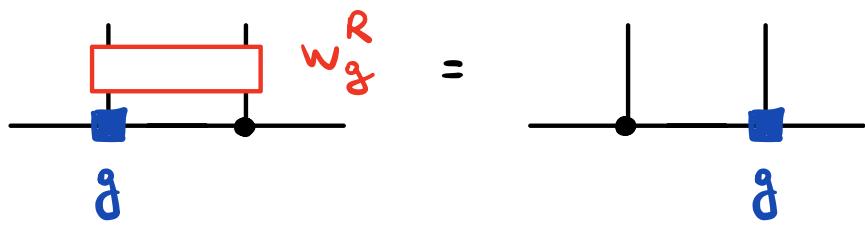

They are defined in terms of known tensors

$$\begin{array}{ccc} \text{---} \bullet \text{---} & = & g \text{---} \circ \text{---} \\ g & & \end{array} = \begin{array}{ccc} \text{---} \bullet \text{---} & = & \text{---} \bullet \text{---} \\ g^{-1} & & g^{-1} \end{array}$$

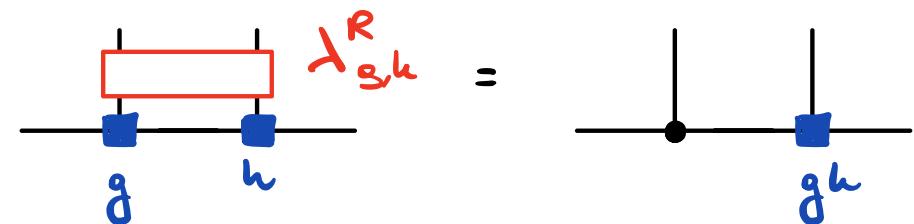

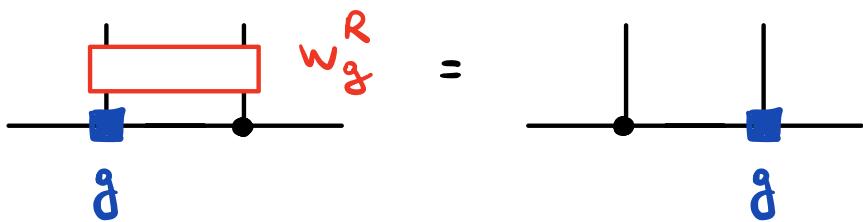

MPU defects (injective case)

Movement and fusion achieved by 2-body unitaries

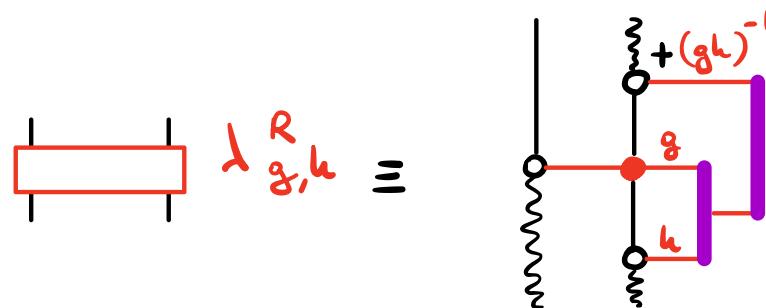

MPU defects (injective case)

Movement and fusion achieved by 2-body unitaries

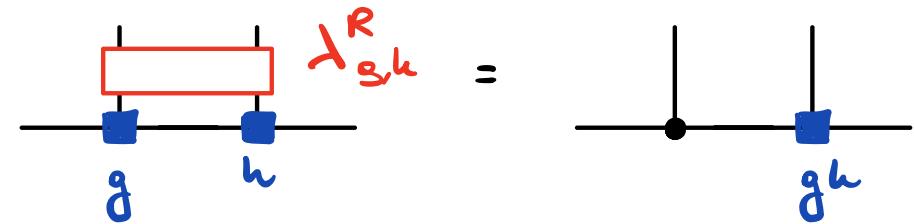

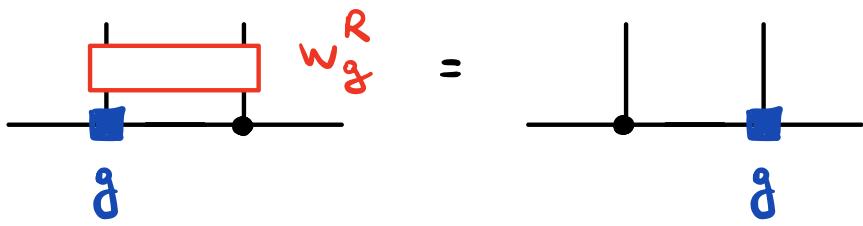

given in terms of known tensors

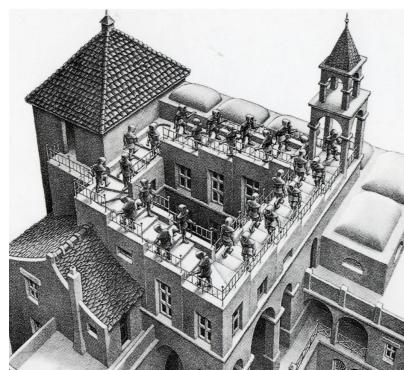

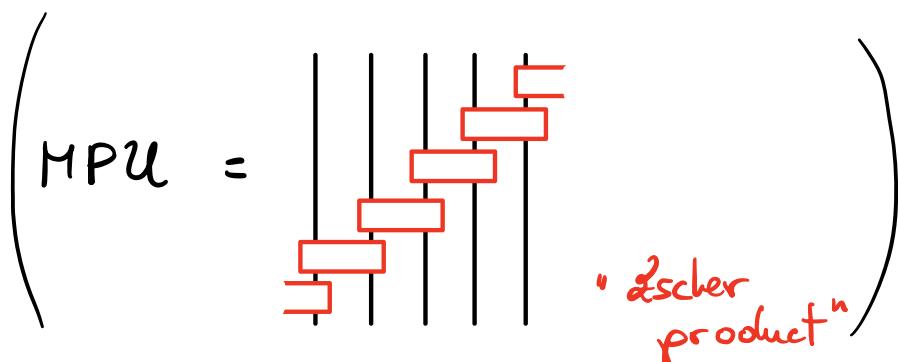

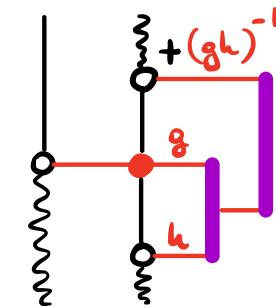

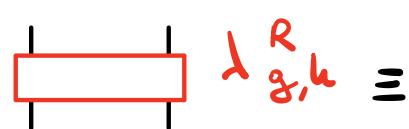

MPU defects (injective case)

Movement and fusion achieved by 2-body unitaries

given in terms of known tensors

$$(w_g^R \equiv \lambda_{g,e}^R)$$

"Ascending and descending", 1960

Side note

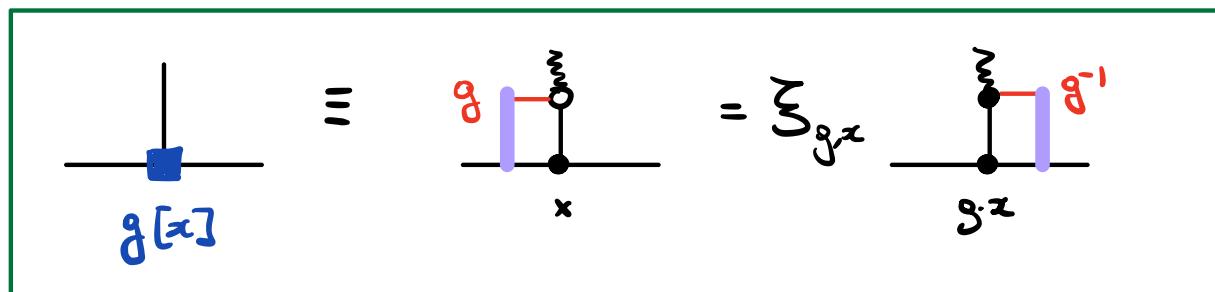

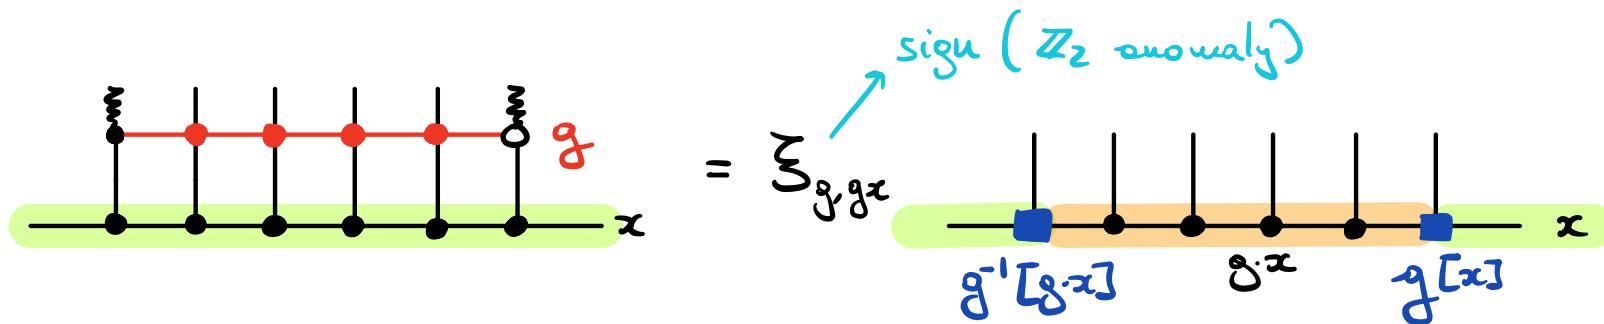

The fusion operators associate up to a scalar, which happens to be the anomaly cocycle :

$$\begin{array}{c} \text{Diagram 1: } \text{Three vertical lines labeled } g, l, k \text{ from left to right. Three red horizontal boxes are placed on the lines: one between } g \text{ and } l, \text{ one between } l \text{ and } k, \text{ and one above } k. \text{ Red labels } \lambda_{g,e}, \lambda_{g,hk}, \text{ and } \lambda_{h,k} \text{ are written near the boxes.} \\ \text{Diagram 2: } \text{Three vertical lines labeled } g, l, k \text{ from left to right. A red horizontal box is placed on the line between } l \text{ and } k. \text{ A red label } \lambda_{gl,k} \text{ is written near the box.} \end{array}$$
$$\lambda_{g,e} \quad \lambda_{g,hk} = \omega(g, h, k) \quad \lambda_{gl,k}$$

MPU defects (non-injective case)

[Haegeman et al. '12]
[Gómez-Rubio, Schuch, '24]

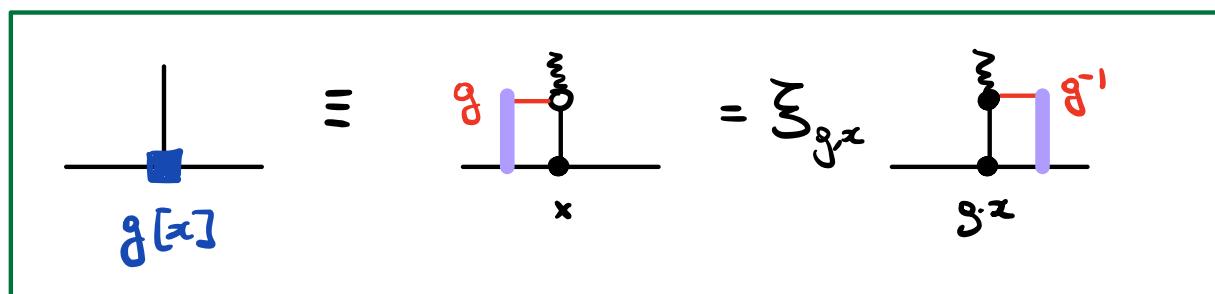

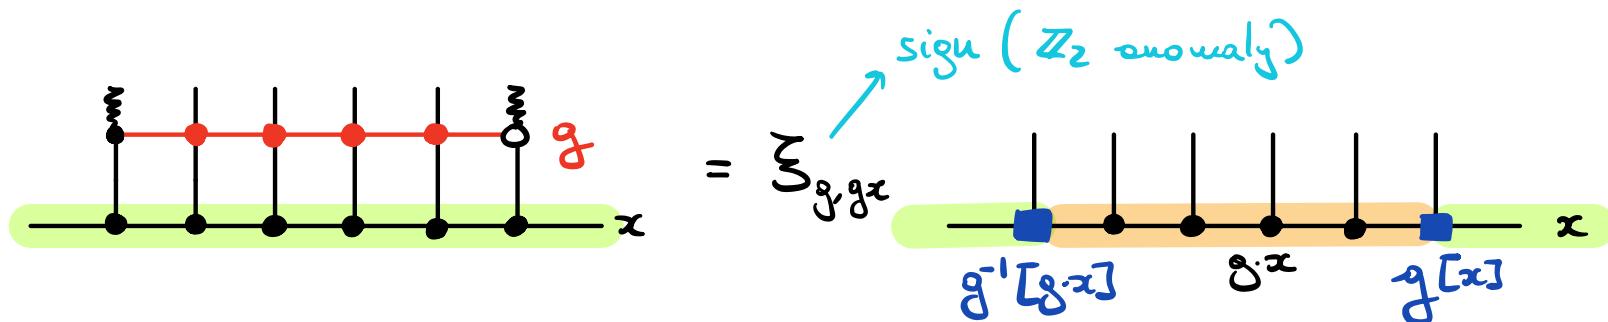

Defects can be domain walls btwn. g.s.

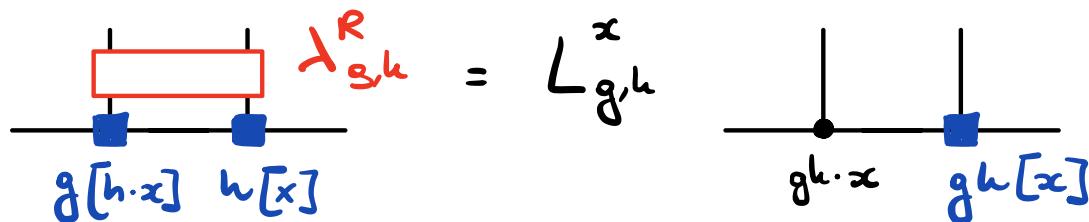

MPU defects (non-injective case)

[Haegeman et al. '12]
 [Garcia-Rubio, Schuch, '24]

Defects can be domain walls btwn. g.s.

Fusion may give rise to "non-trivializable" phases

Example : Ousite case

Defect tensors

$$\begin{array}{c} | \\ \text{---} \\ | \end{array} \quad g \quad = \quad \begin{array}{c} | \\ \text{---} \\ | \end{array} \quad X_g$$

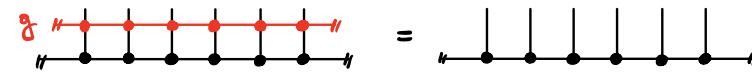

Fusion operator

$$J_{gh}^R \equiv \frac{1}{\mathcal{R}(g,h)} (u_g \otimes \mathbb{1})$$

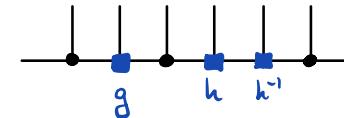

$$\begin{array}{c} | \\ \text{---} \\ | \end{array} \quad u_g \quad X_g \quad = \quad \begin{array}{c} | \\ \text{---} \\ | \end{array} \quad X_g \quad = \quad \mathcal{R}(g,h) \quad \begin{array}{c} | \\ \text{---} \\ | \end{array} \quad X_{gh}$$

Outline

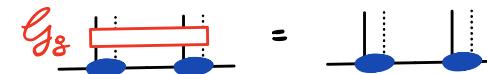

I. Preliminaries

II. Defect systems

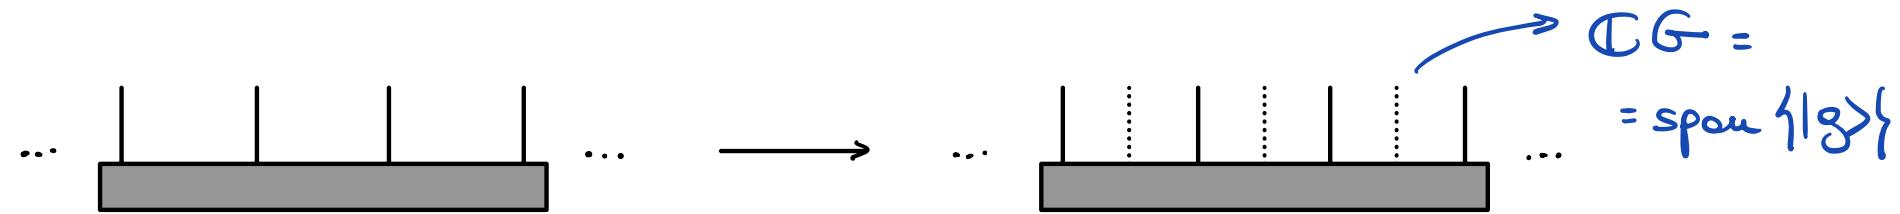

III. Gauging

Time to gauge

Gauging \sim localizing the symmetry by adding \checkmark d.o.f. \Rightarrow
 \Rightarrow new (related) theory!

- Traditionally performed on Lagrangian / Hamiltonian
 (think QED)
- Can also be implemented on the state

local symmetries become gauge constraints (\Rightarrow Gauss's law)

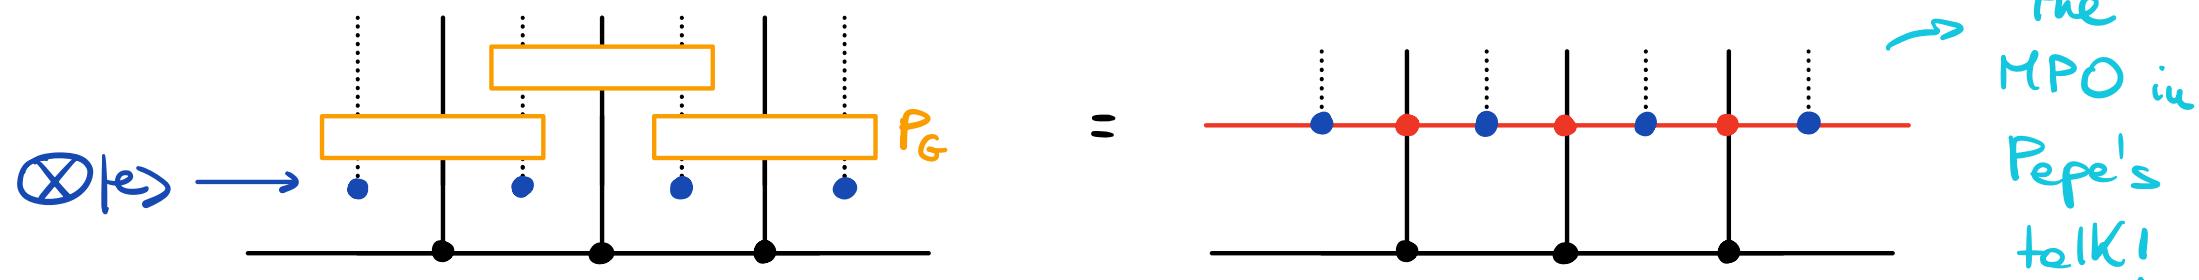

$$\begin{array}{c} \vdots \\ \text{---} \\ \vdots \end{array} \xrightarrow{\text{red box}} \begin{array}{c} \vdots \\ \text{---} \\ \vdots \end{array} = \begin{array}{c} \vdots \\ \text{---} \\ \vdots \end{array}$$

$$P_G^j = \frac{1}{|G|} \sum_g \ell_{gj}^j$$

Projection vs Promotion (onsite)

[Haegeman et al. '14]

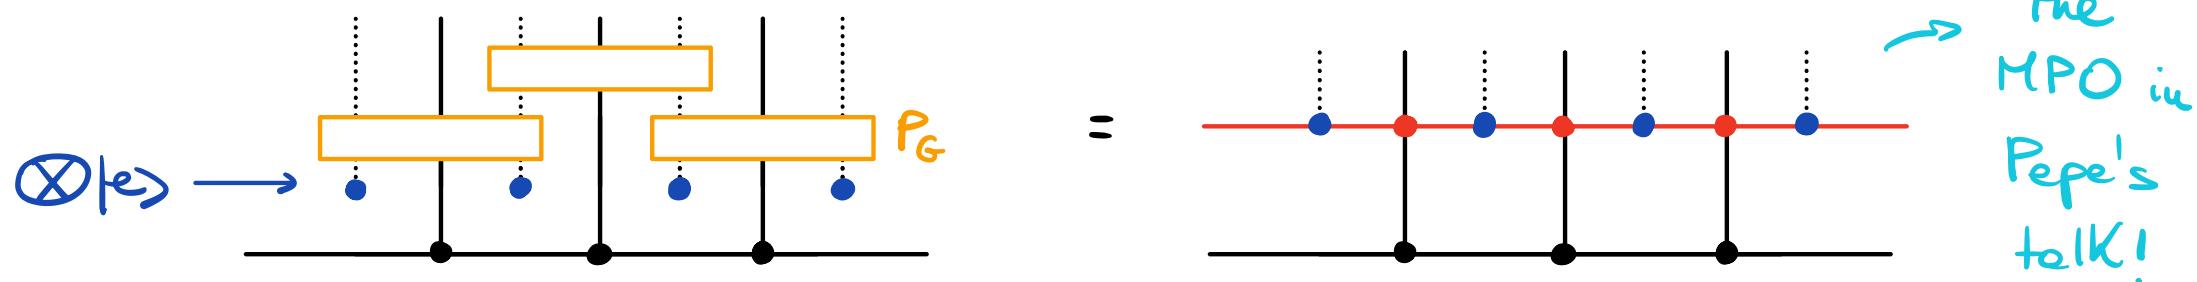

→ Prescription 1: \otimes with gauge dof, project on $\mathcal{H}_{\text{gauge inv.}}$

Projection vs Promotion (onsite)

[Haegeman et al. '14]

→ Prescription 1: \otimes with gauge dof, project on $\mathcal{H}_{\text{gauge inv.}}$

[Kull et al. '17]

→ Prescription 2: promote the virtual defects to gauge dof

$$X_g \rightarrow \begin{array}{c} \dots \\ | \\ \dots \end{array} = \sum_g X_g \otimes |g\rangle$$

$$\begin{array}{c} \dots \\ | \\ \dots \end{array} = \begin{array}{c} R_g^r \\ u_g \\ L_g^r \end{array}$$

Promoting our defect tensors

$$\begin{array}{c} \text{---} \\ | \\ \text{---} \end{array} \xrightarrow{\quad} \begin{array}{c} \text{matter} \\ \curvearrowleft \\ \text{---} \\ | \\ \text{---} \\ \text{---} \end{array} = \sum_g \begin{array}{c} \text{---} \\ | \\ \text{---} \end{array} \otimes |g\rangle$$

g

g

(analogous
for non injective)

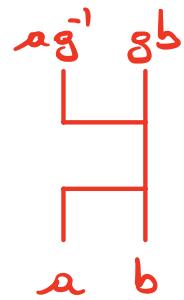

Promoting our defect tensors

$$\begin{array}{c}
 \text{matter} \\
 \text{gauge}
 \end{array}
 \rightarrow
 \begin{array}{c}
 \text{matter} \\
 \text{gauge}
 \end{array}
 \equiv \sum_g
 \begin{array}{c}
 \text{matter} \\
 \text{gauge}
 \end{array}
 \otimes |g\rangle$$

(analogous
for non injective)

For any defect system, [Seifnashri, '23] gives a local representation

$$\ell_{gg} \begin{array}{c} \vdots \vdots \vdots \vdots \\ \square \end{array} \equiv \sum_{ab} \underbrace{\left(\lambda_{ag}, g_b \right)^+}_{\text{matter}} \lambda_{ab} \otimes \underbrace{|ag\rangle g_b \chi_{ab}|}_{\text{gauge}}$$

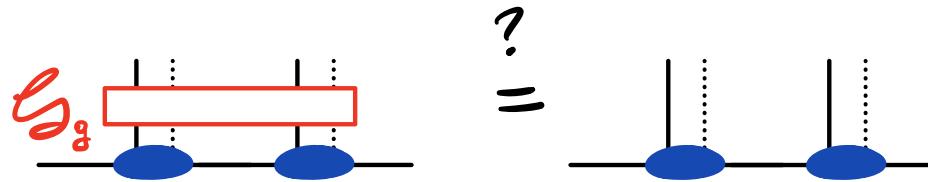

such that, whenever the λ 's associate up to ω , we have

$$[P_G^j, P_G^{j+1}] = 0 \Leftrightarrow \omega = 1$$

i.e., the Gauss laws commute iff the anomaly is trivial.

(recurrent observation)

Gauge invariance of the gauged MPS

Phase factors appear! We have to assume block independence

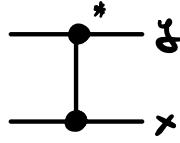

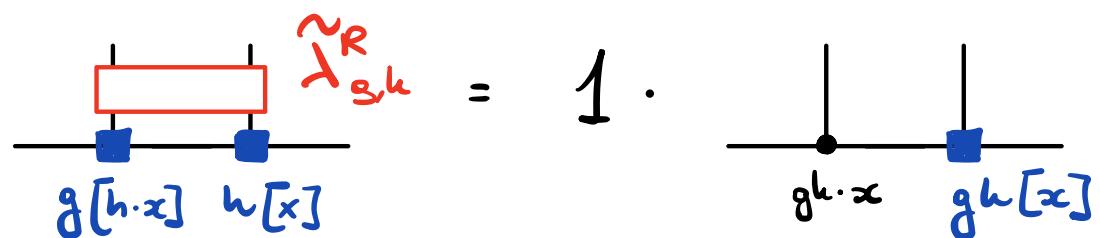

BI: L_{gh}^x can be made = 1

(In particular, no issue in the injective case)

I	BI $L=1$	NA $\omega=1$	A $\omega \neq 1$
---	-------------	------------------	----------------------

- BI can be violated even when $D=1$ (we give a characterization)
- We still have the projectors: if the anomaly is trivial we can try to go the projective route.

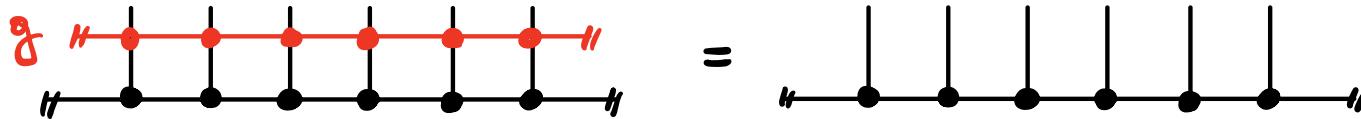

State-level gauging

- Alternatively, we can modify the local symmetry rep. to ensure our candidate MPS is gauge invariant...
- Condition: local orthogonality  $\propto \delta_{x,y}$ (\sim RG fixed pt)
- Intuition: modify $\lambda \rightarrow \tilde{\lambda}$ 
- Drawback: $\tilde{\lambda}$'s don't associate, P_G don't commute
(but they do on a subspace...)
Does this have any nontrivial physical meaning?

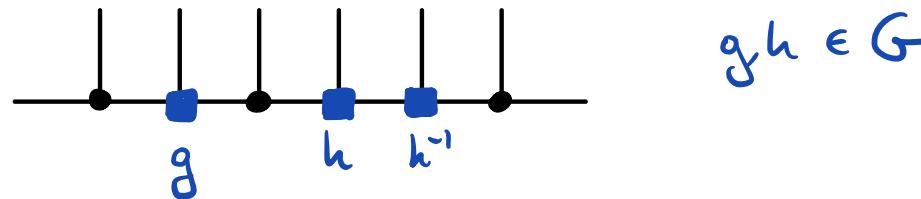

In one slide

finite group

Consequences of MPU symmetry for MPS

↳ System of defect tensors

↳ Gauging procedure (Global sym. $\xrightarrow{\text{odd d.o.f.}}$ Local sym.)

Gauged tensor

$$\begin{array}{c} | \\ - \end{array} = \sum_g \begin{array}{c} | \\ - \\ \textcolor{blue}{g} \end{array} \otimes |g\rangle$$

Locally invariant wavefunction

$$g_g \begin{array}{c} | \\ - \\ \vdots \end{array} = \begin{array}{c} | \\ - \\ \vdots \\ \textcolor{blue}{g} \end{array}$$

provided BI holds, otherwise: projective, state-level ...

Thank you for your attention !
