Superradiance and Ergoregion Instabilities in Rotating Polariton Fluids

Paula A. Calizaya Cabrera

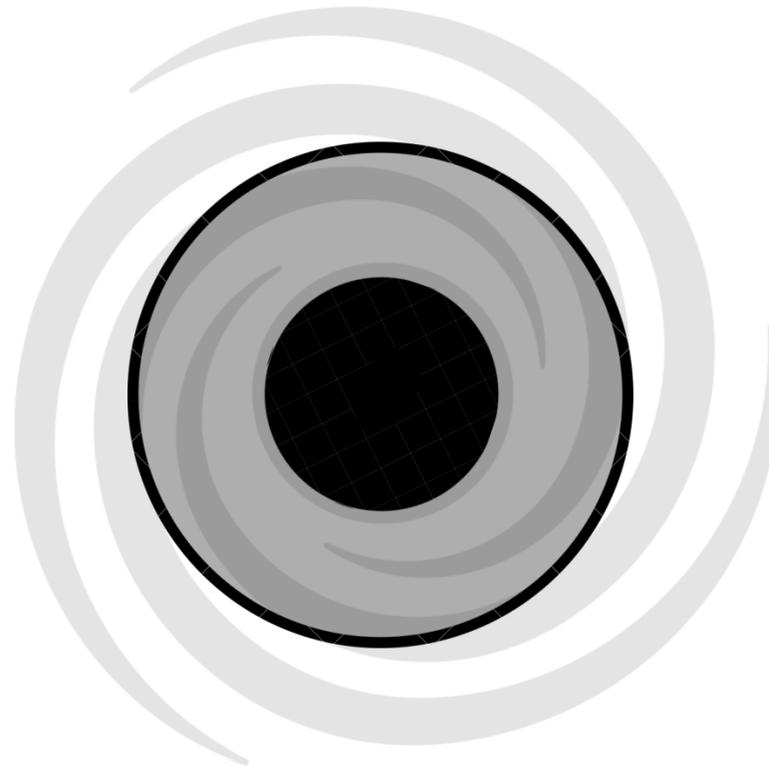

in collaboration with Killian Guerrero, Luca Giacomelli,
Adria Delhom, Maxime Jacquet & Ivan Agullo

The Basics of Rotational Superradiance

Rotating (Kerr) Black Holes

One can **extract energy and angular momentum from Kerr Black Holes**

Penrose, et al. Nature Physical Science (1971)

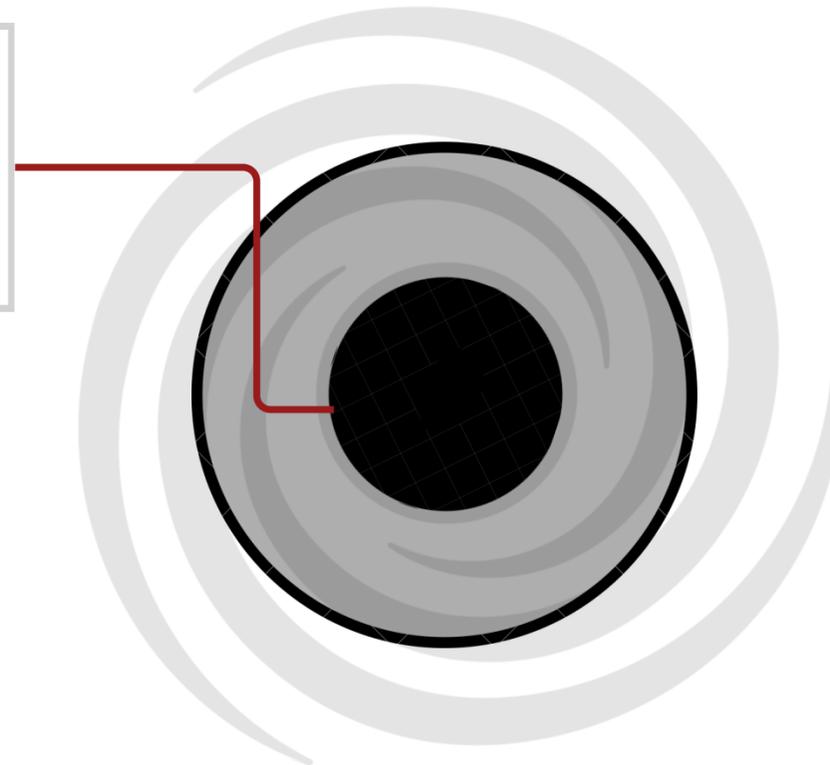

Rotating (Kerr) Black Holes

One can **extract energy and angular momentum from Kerr Black Holes**

Penrose, et al. Nature Physical Science (1971)

Event Horizon: boundary of the region of spacetime excluding the causal past of future null infinity

Observers many never escape this region

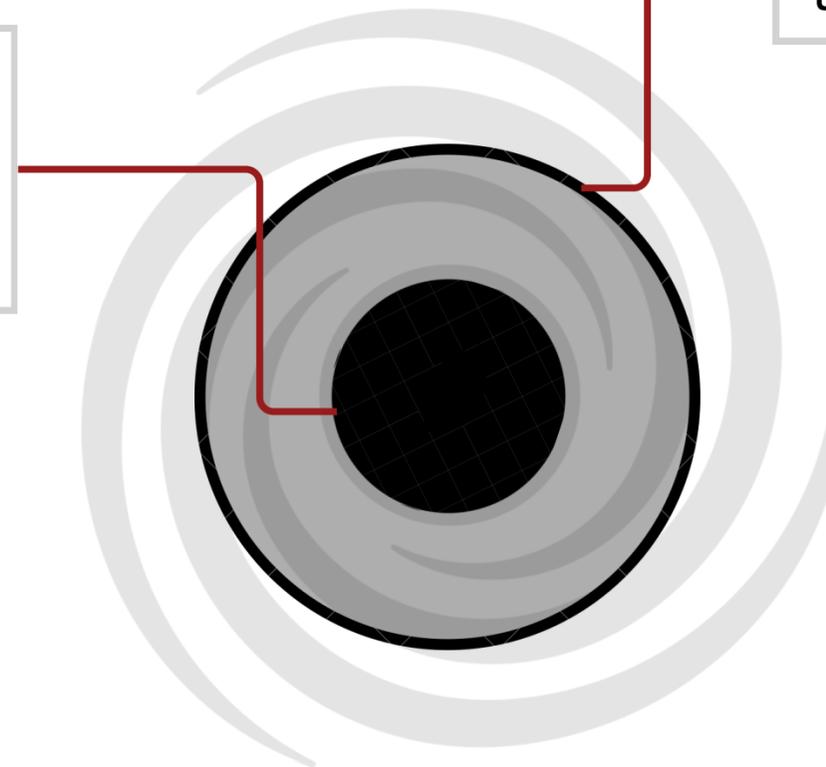

Rotating (Kerr) Black Holes

One can **extract energy and angular momentum from Kerr Black Holes**

Penrose, et al. Nature Physical Science (1971)

Event Horizon: boundary of the region of spacetime excluding the causal past of future null infinity

Observers many never escape this region

Ergosurface: Where the time translation Killing vector becomes null

Observer at the **ergoregion** are dragged and forced to co-rotate with the black hole.

Observers may escape the ergoregion

Amplification of scattered waves (from an ergoregion)

$$W_-^{\text{in}} \longrightarrow T W_-^{\text{out}} + R W_+^{\text{out}}$$

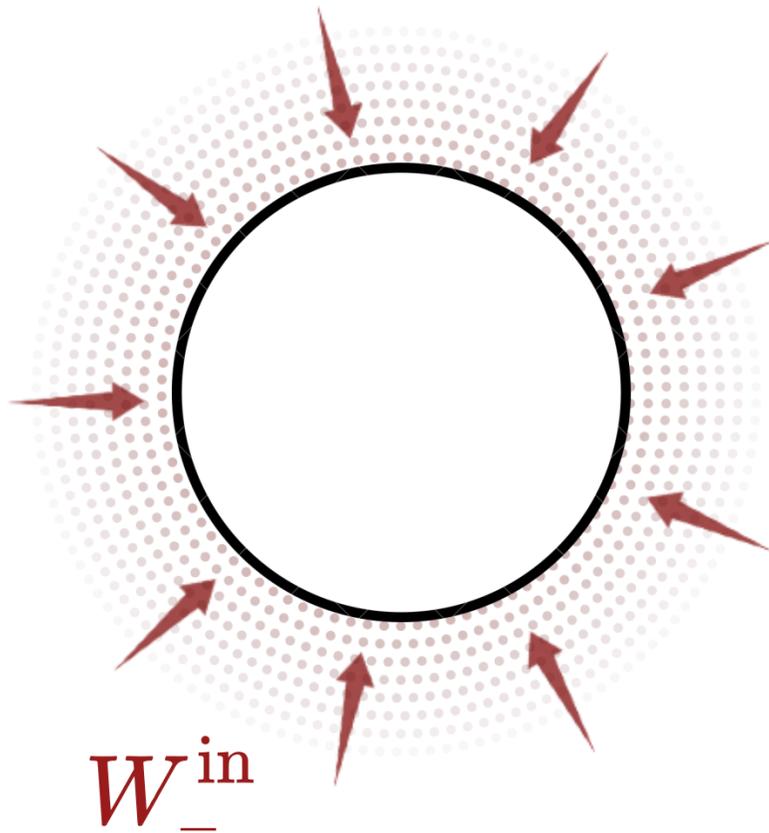

Amplification of scattered waves (from an ergoregion)

$$W_-^{\text{in}} \longrightarrow T W_-^{\text{out}} + R W_+^{\text{out}}$$

INPUT:

spheroidal waves of
specific frequency
and **angular momentum**

Zel'dovich,
Zh.Eksp.Teor.Fiz.
(1972)

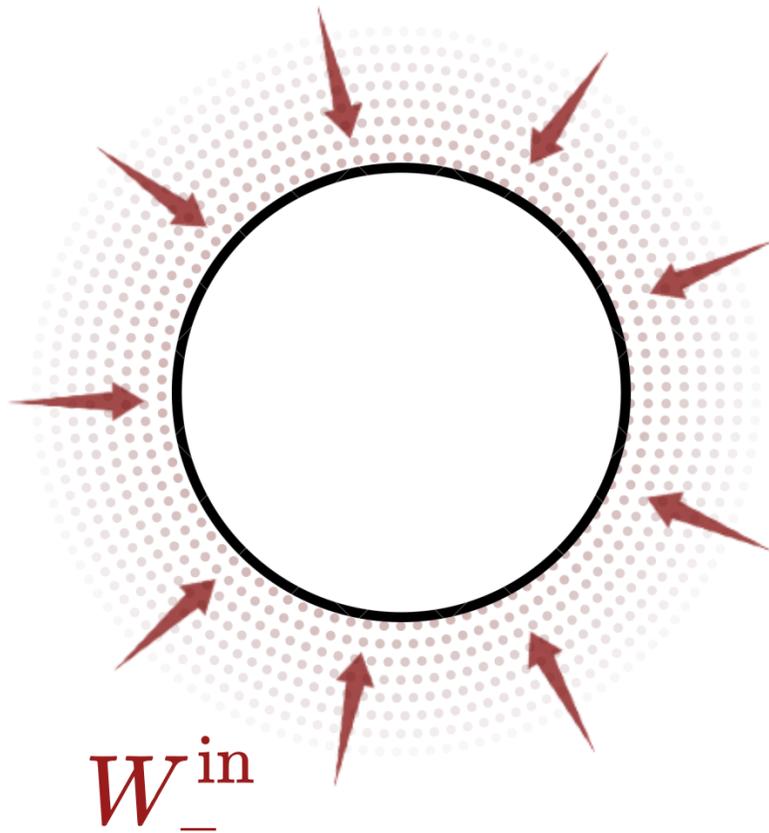

Amplification of scattered waves (from an ergoregion)

$$W_-^{\text{in}} \longrightarrow T W_-^{\text{out}} + R W_+^{\text{out}}$$

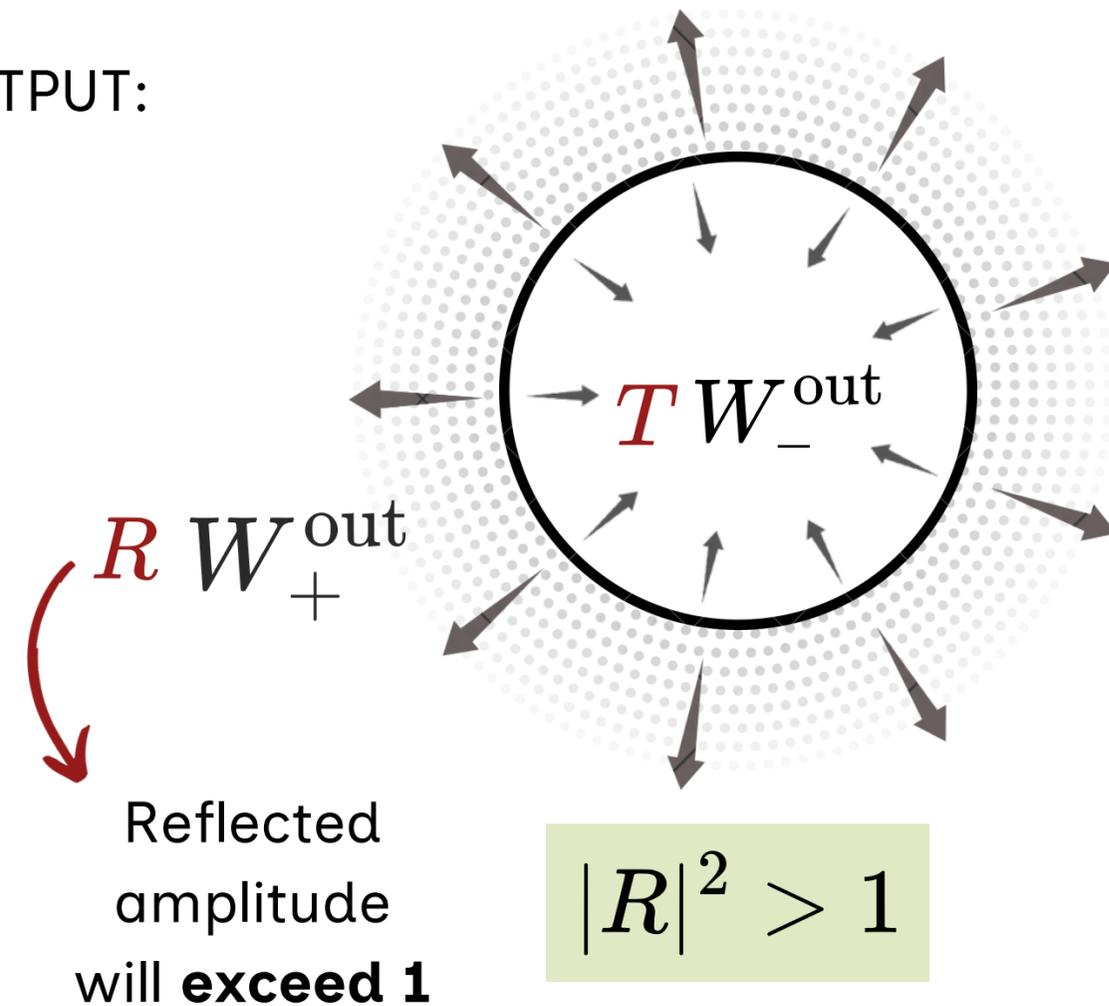

INPUT:

spheroidal waves of **specific frequency** and **angular momentum**

Zel'dovich,
Zh.Eksp.Teor.Fiz.
(1972)

OUTPUT:

Why does Superradiance Happen?

Bosonic field theory allows for superradiance

Consider the KG equation $[\nabla^\mu \nabla_\mu + M^2] \Phi(t, x) = 0$

With conserved quantity $N(\Phi) = (\Phi, \Phi)_{\text{KG}}$ where π is
given by the pseudoscalar product the
conjugate
momentum

$$(\Phi_1, \Phi_2)_{\text{KG}} = i \int dx (\Phi_1^* \pi_2 - \pi_1^* \Phi_2)$$

Why does Superradiance Happen?

Bosonic field theory allows for superradiance

Consider the KG equation $[\nabla^\mu \nabla_\mu + M^2] \Phi(t, x) = 0$

With conserved quantity $N(\Phi) = (\Phi, \Phi)_{\text{KG}}$ where π is the conjugate momentum given by the pseudoscalar product

$$(\Phi_1, \Phi_2)_{\text{KG}} = i \int dx (\Phi_1^* \pi_2 - \pi_1^* \Phi_2)$$

negative norms are allowed!

the
conjugate
momentum

Why does Superradiance Happen?

Bosonic field theory allows for superradiance

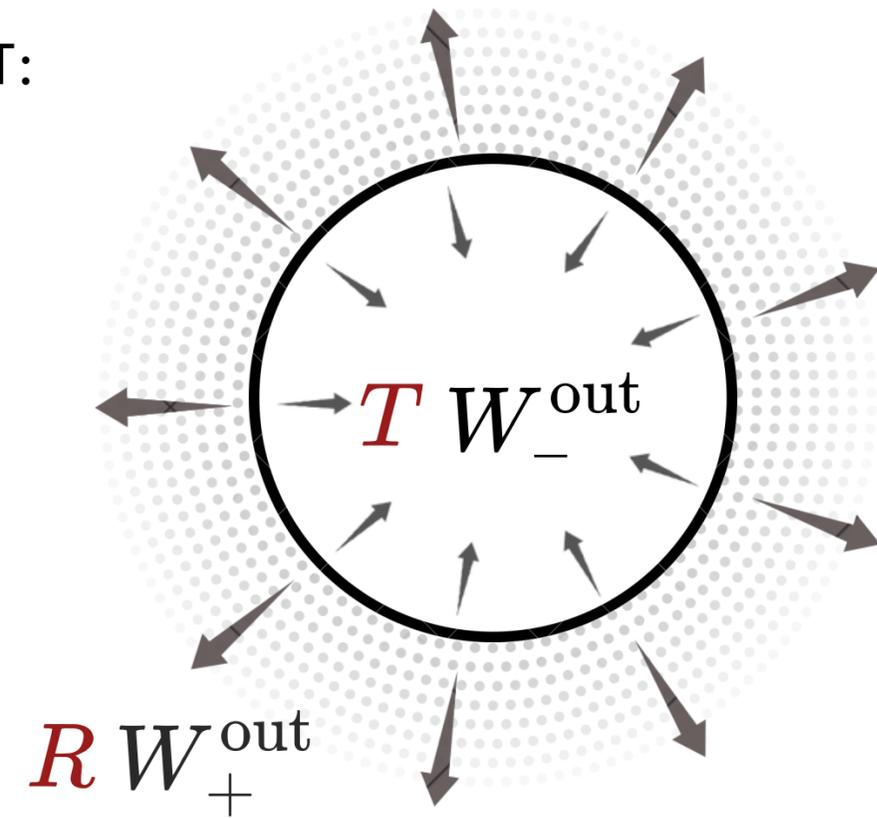

Consider the KG equation $[\nabla^\mu \nabla_\mu + M^2] \Phi(t, x) = 0$

With conserved quantity $N(\Phi) = (\Phi, \Phi)_{\text{KG}}$ where π is the conjugate momentum given by the pseudoscalar product

$$(\Phi_1, \Phi_2)_{\text{KG}} = i \int dx (\Phi_1^* \pi_2 - \pi_1^* \Phi_2)$$

negative norms are allowed!

OUTPUT:

Norm conservation requires

$$1 = \frac{N(W_+^{\text{out}})}{N(W_-^{\text{in}})} |R|^2 + \frac{N(W_-^{\text{out}})}{N(W_-^{\text{in}})} |T|^2$$

Why does Superradiance Happen?

Bosonic field theory allows for superradiance

Consider the KG equation $[\nabla^\mu \nabla_\mu + M^2] \Phi(t, x) = 0$

With conserved quantity $N(\Phi) = (\Phi, \Phi)_{\text{KG}}$ where π is the conjugate momentum given by the pseudoscalar product

$$(\Phi_1, \Phi_2)_{\text{KG}} = i \int dx (\Phi_1^* \pi_2 - \pi_1^* \Phi_2)$$

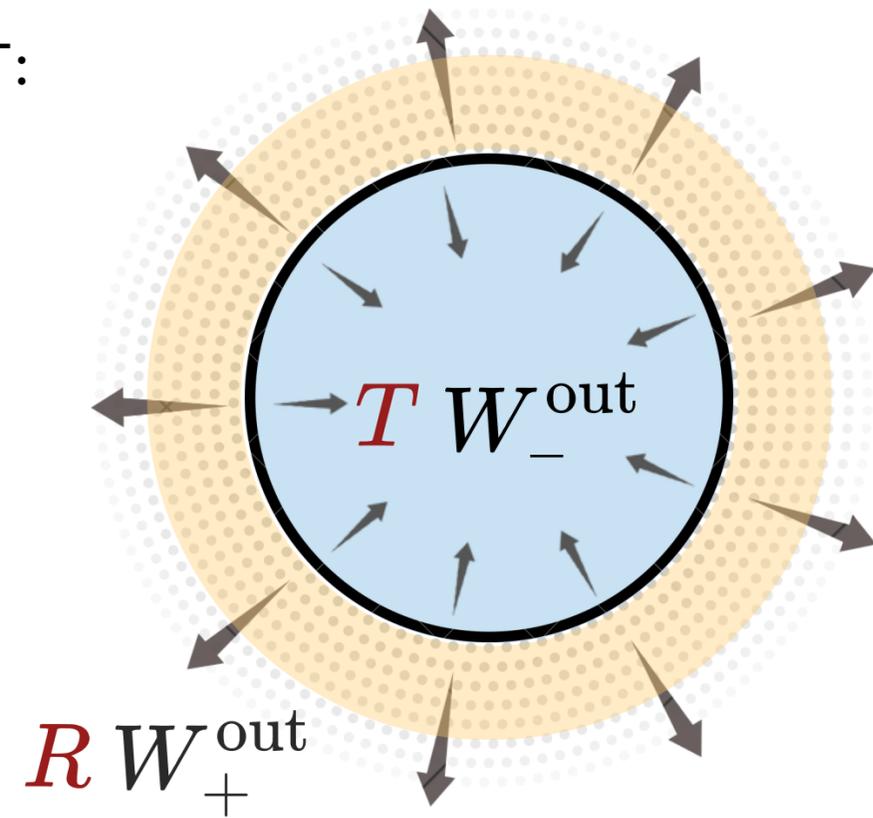

negative norms are allowed!

Superradiance happens when

$$N(W_-^{\text{out}}) < 0$$

Bosonic field theories allow negative norms 

OUTPUT:

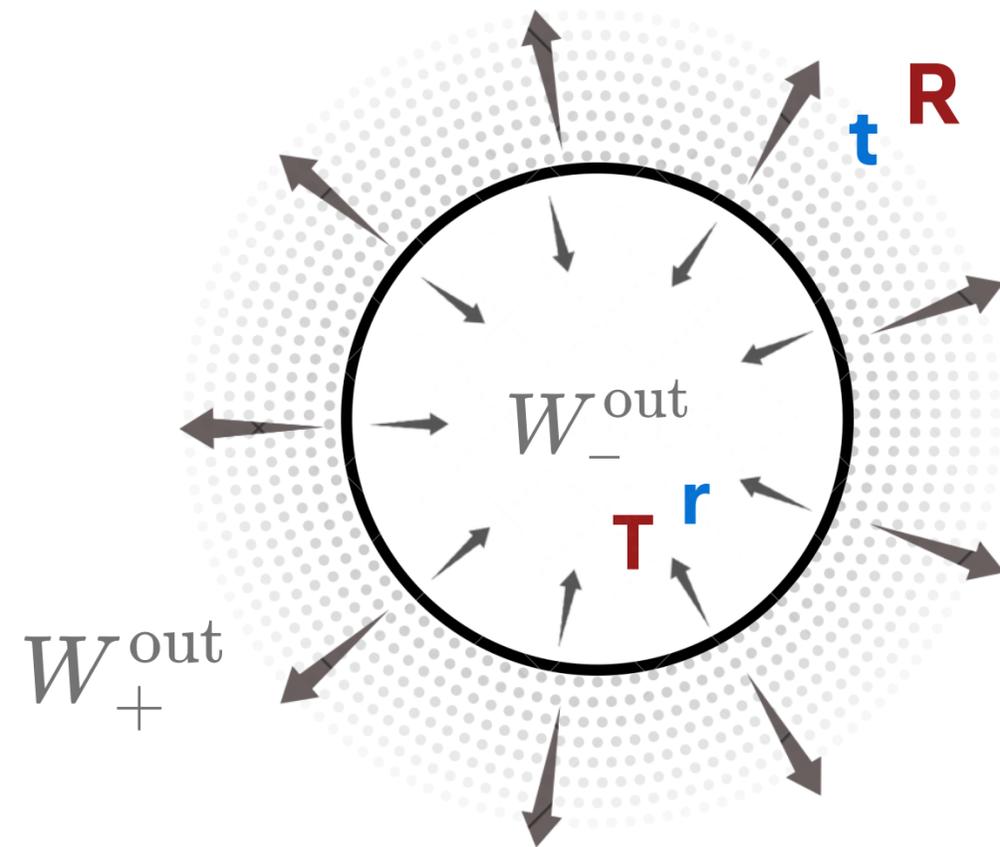

Norm conservation requires

$$1 = \frac{N(W_+^{\text{out}})}{N(W_-^{\text{in}})} |R|^2 + \frac{N(W_-^{\text{out}})}{N(W_-^{\text{in}})} |T|^2$$

$$1 = |R|^2 - |T|^2$$

Superradiance Generates Entangled Pairs

Delhom, Guerrero, Jacquet, PC et al. Phys. Rev. D 109, 105024 (2024)

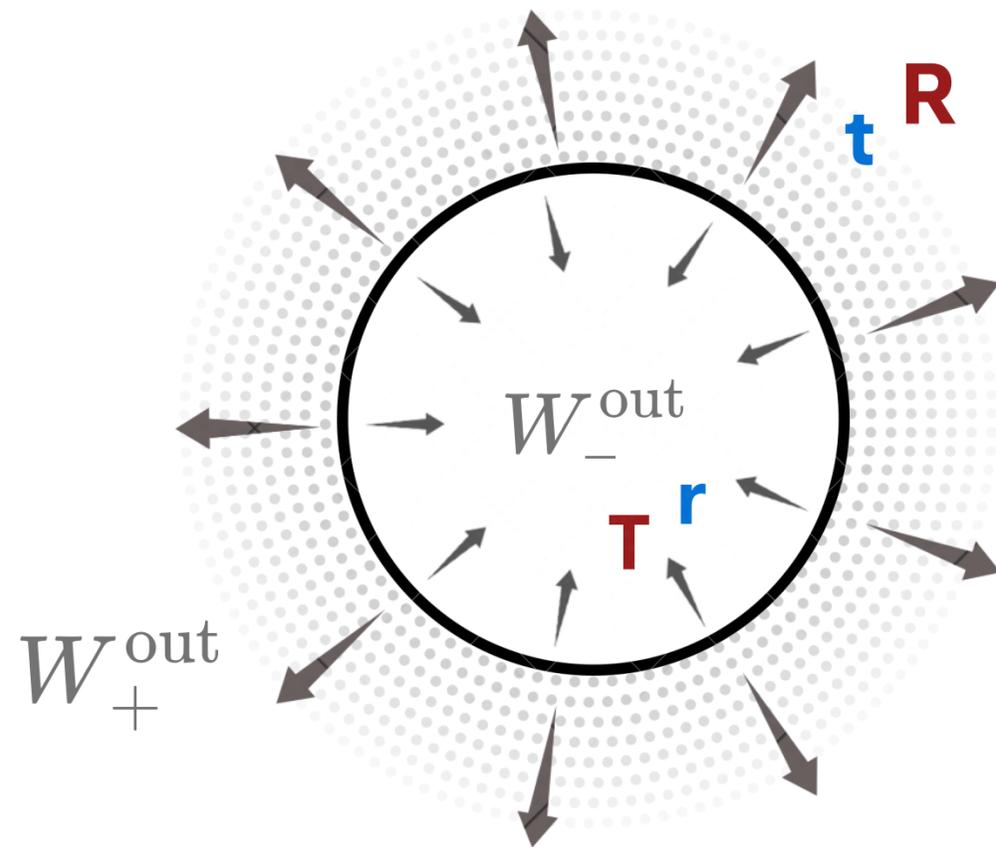

Take a complex solution to the KG equation, W_i centered at some specific frequency.

$$\begin{aligned}
 \mathbf{N}(W_i) = 1 & \xrightarrow{\text{defines}} \hat{a}_i = (W_i, \hat{\Phi})_{\text{KG}} \\
 \mathbf{N}(W_i) = -1 & \xrightarrow{\text{defines}} \hat{a}_i^\dagger
 \end{aligned}$$

bosonic field operator \leftarrow

Superradiance Generates Entangled Pairs

Delhom, Guerrero, Jacquet, PC et al. Phys. Rev. D 109, 105024 (2024)

Take a complex solution to the KG equation, W_i centered at some specific frequency.

$$N(W_i) = 1 \quad \xrightarrow{\text{defines}} \quad \hat{a}_i = (W_i, \hat{\Phi})_{\text{KG}}$$

$$N(W_i) = -1 \quad \xrightarrow{\text{defines}} \quad \hat{a}_i^\dagger$$

The scattering problem leads to a **mixing** of creation and annihilation operators, i.e.

$$\hat{a}_-^{\text{out}} = r \hat{a}_+^{\text{in}} + T \hat{a}_-^{\text{in}\dagger}$$

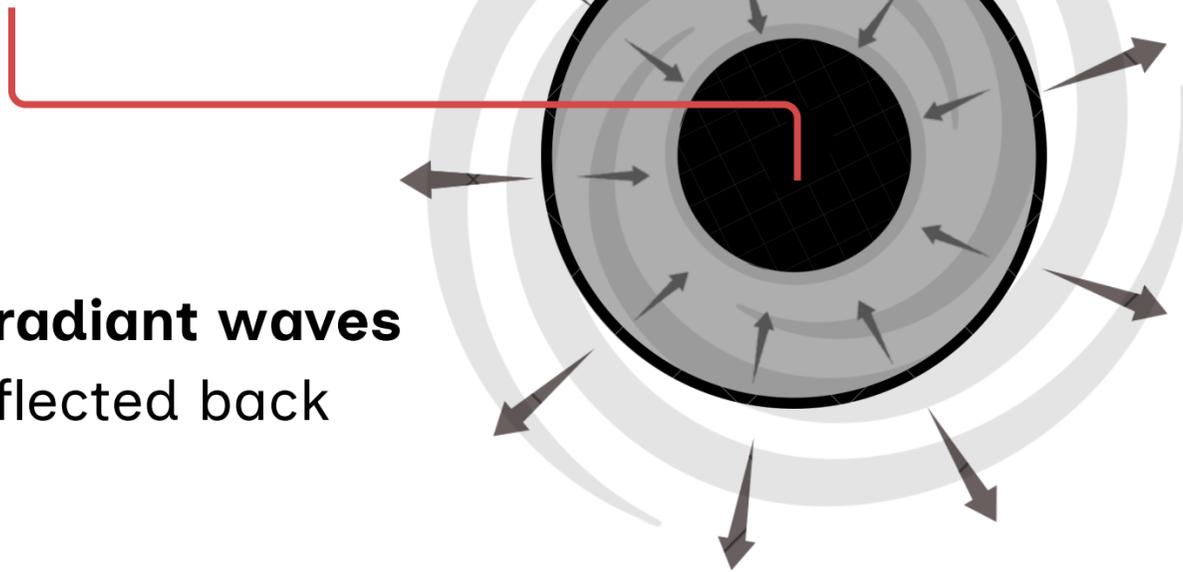

Superradiant scattering is a two-mode squeezer

End of Superradiance Basics

Ergoregions

Superradiant Scattering from a Rotating Black Hole

Transmitted waves get sucked in by the horizon

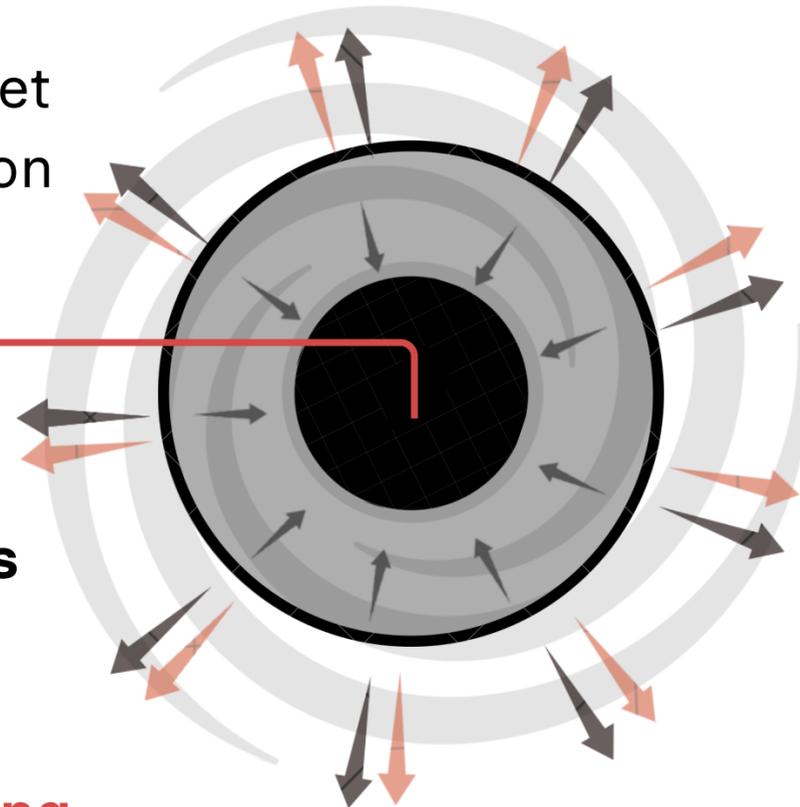

Superradiant waves are reflected back

Superradiant Scattering from a Rotating Black Hole

Transmitted waves get sucked in by the horizon

Superradiant waves are reflected back

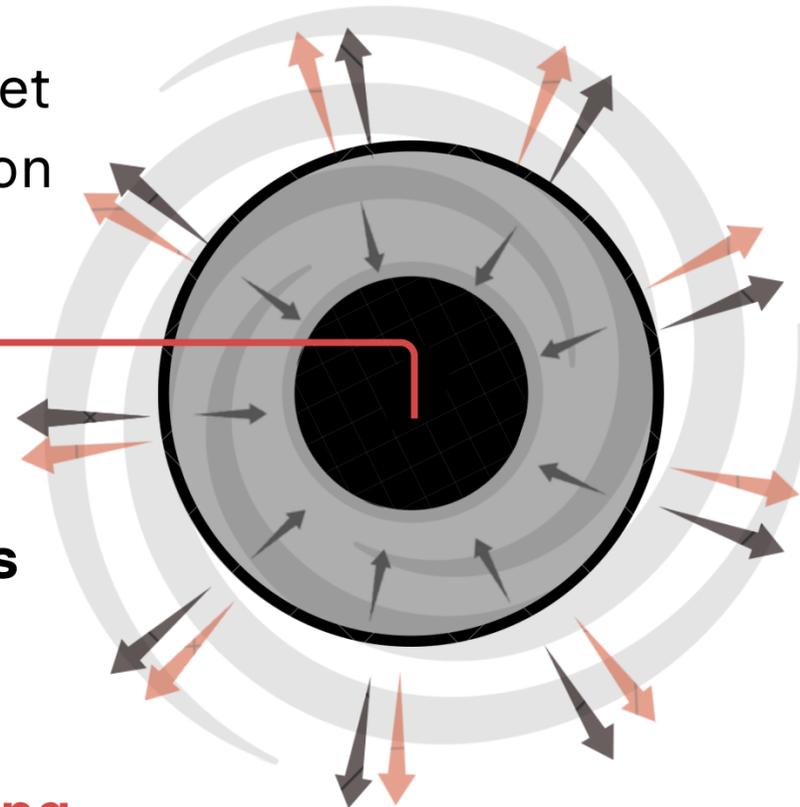

Along with **Hawking Radiation** from the Horizon

Superradiant Scattering from a Rotating Black Hole

note the rotational symmetry

Polariton lifetime

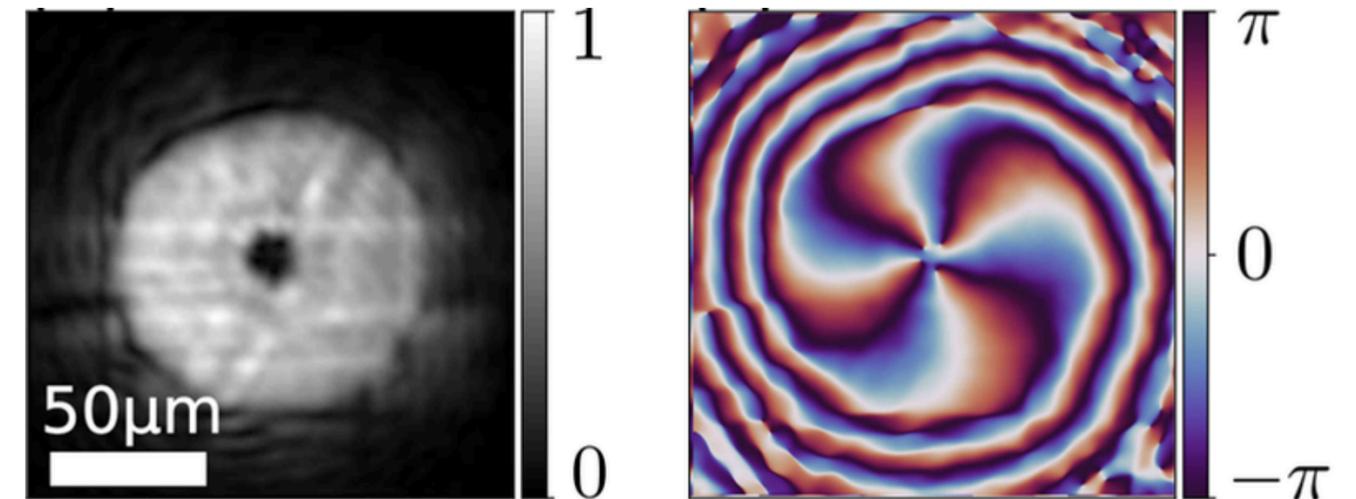

$$\tau = 10\text{ps}$$

pump

Continuous pumping compensates for the losses and let us create a steady state

Stationary C=4 Vortex Solution

Density and Phase of the Polariton Field

Guerrero et al. Phys. Rev. Lett. 135, 243801 (2025)

We want to study the scattering of small perturbations on a steady polariton background

The Polariton Background

Characterized by a mean-field wavefunction

$$\Psi(t, \mathbf{r}) = \sqrt{n(\mathbf{r})} e^{i\phi(\mathbf{r})}$$

solving the driven-dissipative GPE:

$$i\hbar \frac{\partial \Psi}{\partial t} = \left(\hbar\omega_0 - \frac{\hbar^2 \nabla^2}{2M} + \hbar g |\Psi|^2 - i\hbar \frac{\gamma}{2} \right) \Psi + i\hbar \mathcal{F}(\mathbf{r}, t)$$

Fluid velocity

$$\mathbf{v} \propto \nabla \phi$$

Speed of sound

$$c_s \propto \sqrt{n(r)}$$

The Polariton Background

Characterized by a mean-field wavefunction

$$\Psi(t, \mathbf{r}) = \sqrt{n(\mathbf{r})} e^{i\phi(\mathbf{r})}$$

solving the driven-dissipative GPE:

$$i\hbar \frac{\partial \Psi}{\partial t} = \left(\hbar\omega_0 - \frac{\hbar^2 \nabla^2}{2M} + \hbar g |\Psi|^2 - i\hbar \frac{\gamma}{2} \right) \Psi + i\hbar \mathcal{F}(\mathbf{r}, t)$$

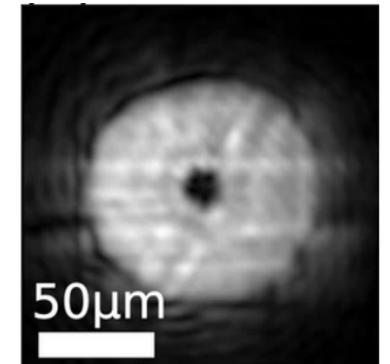

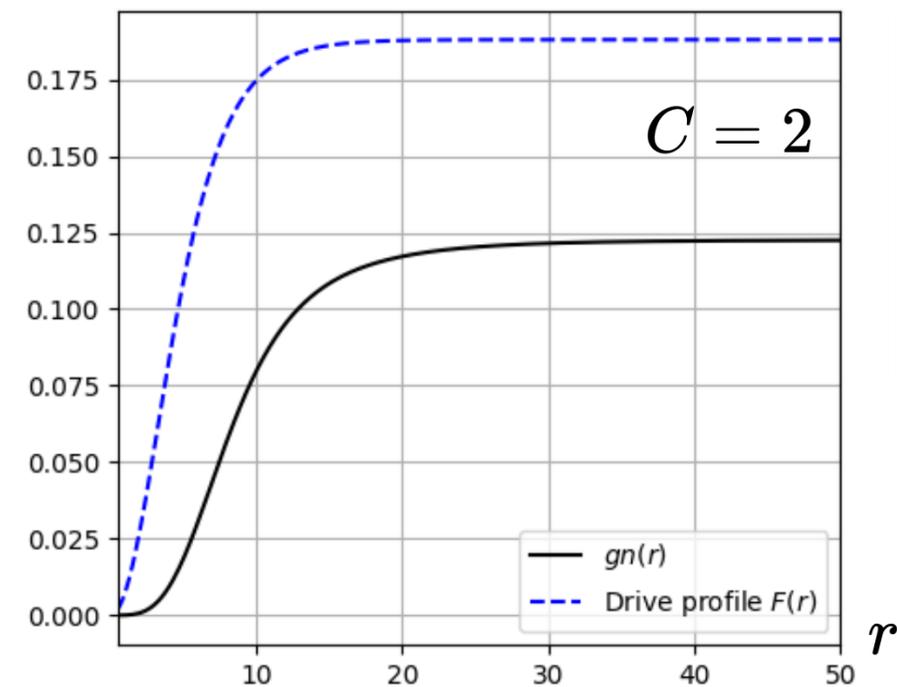

Fluid velocity

$$\mathbf{v} \propto \nabla \phi$$

Speed of sound

$$c_s \propto \sqrt{n(r)}$$

1D Numerical Simulations

Speed of sound

$$c_s \propto \sqrt{n(r)}$$

ergoregion : $c_s < v_\theta$ ✓

1D Numerical Simulations

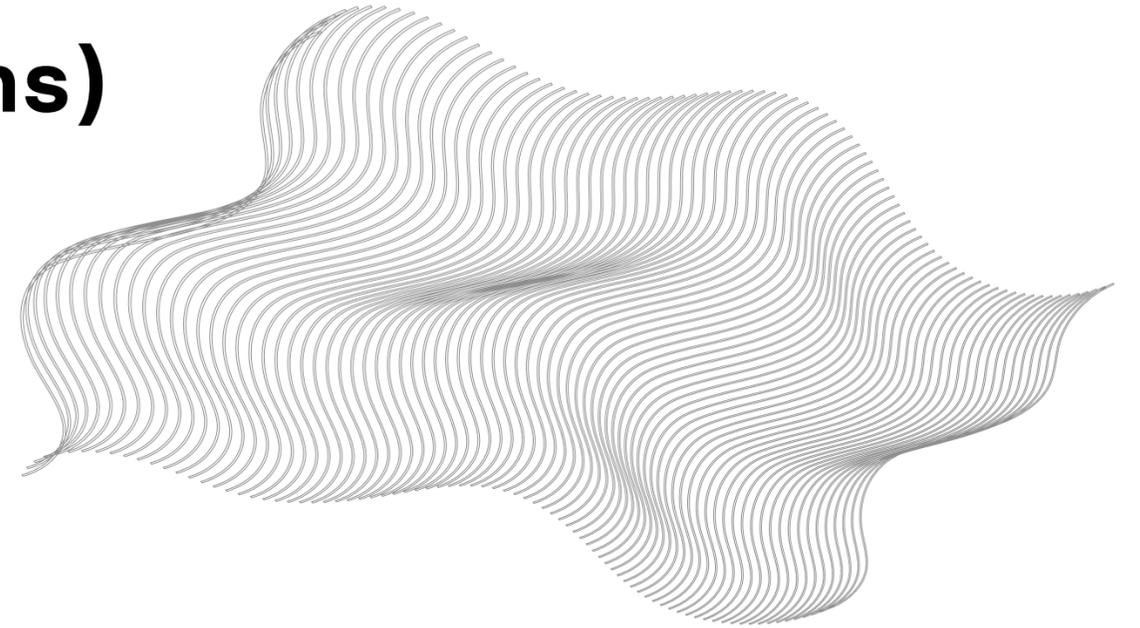

Scattering of Linear Perturbations (Phonons)

$$\Psi = \Psi_0 + \psi$$

$$i\hbar \frac{\partial \Psi}{\partial t} = \left(\hbar\omega_0 - \frac{\hbar^2 \nabla^2}{2M} + \hbar g |\Psi|^2 - i\hbar \frac{\gamma}{2} \right) \Psi + i\hbar \mathcal{F}(\mathbf{r}, t)$$

non-linearity losses pump

Linearize and obtain the **Bogoliubov de-Gennes equation**

$$i\hbar \frac{d}{dt} \begin{pmatrix} \psi \\ \psi^* \end{pmatrix} = (\mathcal{L}_{\text{BdG}} + i\hbar \frac{\gamma}{2}) \begin{pmatrix} \psi \\ \psi^* \end{pmatrix}$$

$$\mathcal{L}_{\text{BdG}} = \begin{pmatrix} A & B \\ -B^* & -A^* \end{pmatrix}$$

$$A = -\frac{\hbar^2}{2m} \nabla^2 + 2gn_0 - \hbar(\omega_p - \omega_0)$$

background detuning

$$B = g\Psi_0^2$$

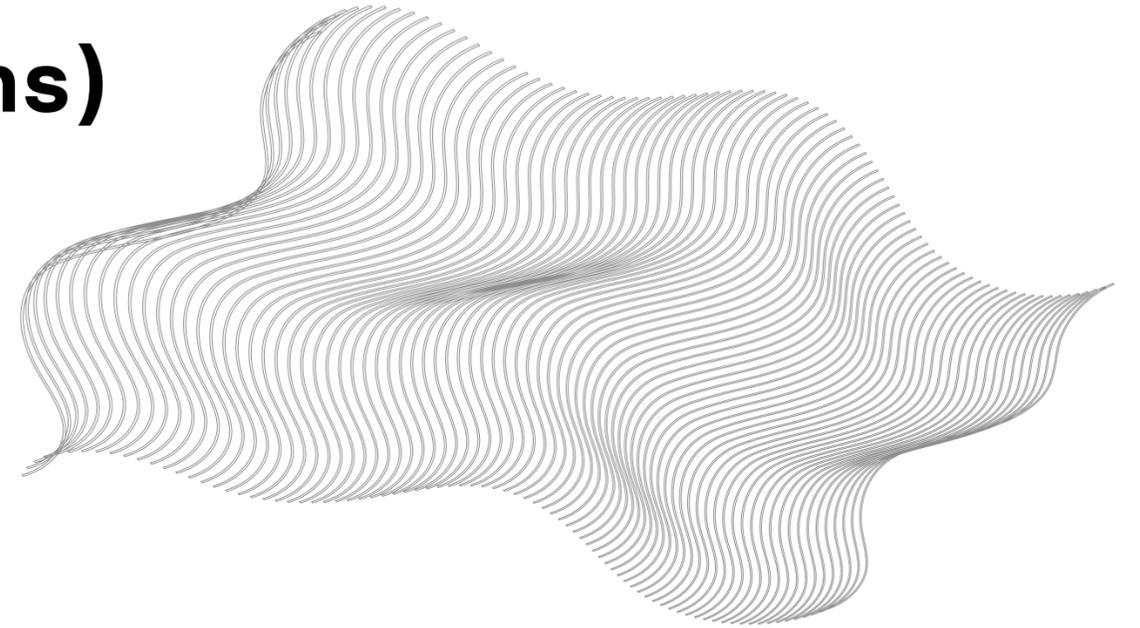

background

Scattering of Linear Perturbations (Phonons)

$$\Psi = \Psi_0 + \psi$$

$$i\hbar \frac{\partial \Psi}{\partial t} = \left(\hbar\omega_0 - \frac{\hbar^2 \nabla^2}{2M} + \hbar g |\Psi|^2 - i\hbar \frac{\gamma}{2} \right) \Psi + i\hbar \mathcal{F}(\mathbf{r}, t)$$

non-linearity
losses
pump

Linearize and obtain the **Bogoliubov de-Gennes equation**

$$A = -\frac{\hbar^2}{2m} \nabla^2 + 2gn_0 - \hbar(\omega_p - \omega_0)$$

$$i\hbar \frac{d}{dt} \begin{pmatrix} \psi \\ \psi^* \end{pmatrix} = \left(\mathcal{L}_{\text{BdG}} + i\hbar \frac{\gamma}{2} \right) \begin{pmatrix} \psi \\ \psi^* \end{pmatrix}$$

The losses will appear as a shift in the frequency's complex plane

$$\mathcal{L}_{\text{BdG}} = \begin{pmatrix} A & B \\ -B^* & -A^* \end{pmatrix}$$

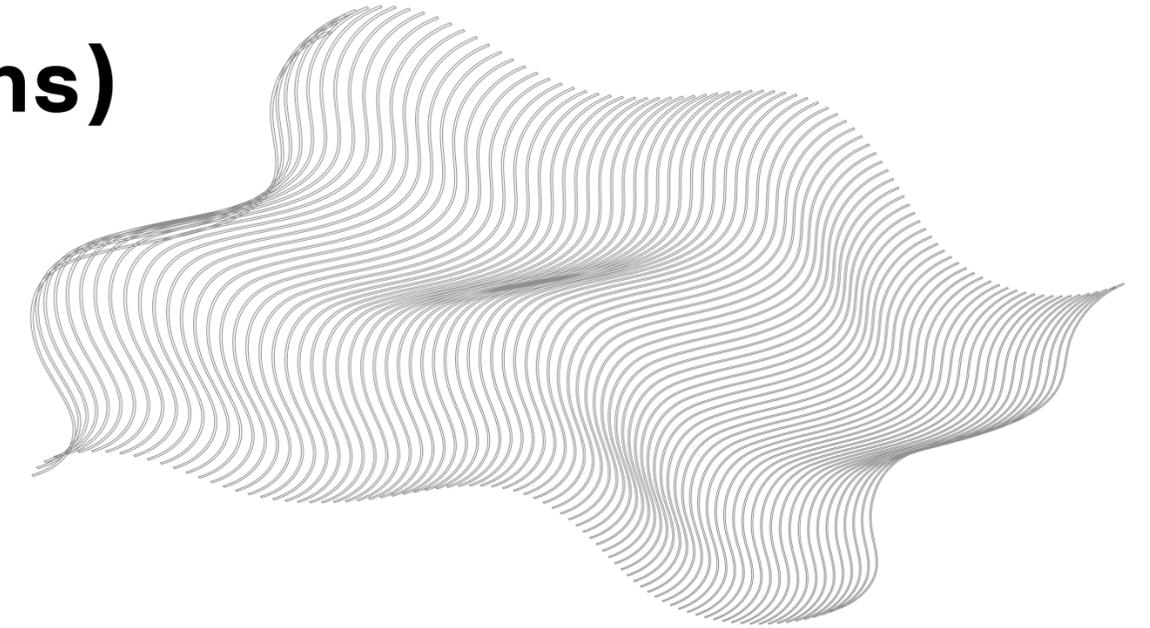

$$B = g\Psi_0^2$$

Scattering of Linear Perturbations (Phonons)

$$\Psi = \Psi_0 + \psi$$

$$i\hbar \frac{\partial \Psi}{\partial t} = \left(\hbar\omega_0 - \frac{\hbar^2 \nabla^2}{2M} + \hbar g |\Psi|^2 - i\hbar \frac{\gamma}{2} \right) \Psi + i\hbar \mathcal{F}(\mathbf{r}, t)$$

non-linearity losses pump

Linearize and obtain the **Bogoliubov de-Gennes equation**

$$i\hbar \frac{d}{dt} \begin{pmatrix} \psi \\ \psi^* \end{pmatrix} = \left(\mathcal{L}_{\text{BdG}} + i\hbar \frac{\gamma}{2} \right) \begin{pmatrix} \psi \\ \psi^* \end{pmatrix}$$

$$\mathcal{L}_{\text{BdG}} = \begin{pmatrix} A & B \\ -B^* & -A^* \end{pmatrix}$$

The losses will appear as a shift in the frequency's complex plane

Eigenstates of the equation:

$$\hbar \left(\omega - \frac{i\gamma}{2} \right) \begin{pmatrix} u \\ v \end{pmatrix} = \mathcal{L}_{\text{BdG}} \begin{pmatrix} u \\ v \end{pmatrix}$$

in this basis, the norm is computed as

$$N = 2\pi \int (|u|^2 - |v|^2) r dr$$

Analysis of Solutions

Analytical Solution via WKB

plane wave ansatz: $u(t, \mathbf{r}) = e^{-i(\omega t - m\theta)} A(r) e^{i \int p dr}$

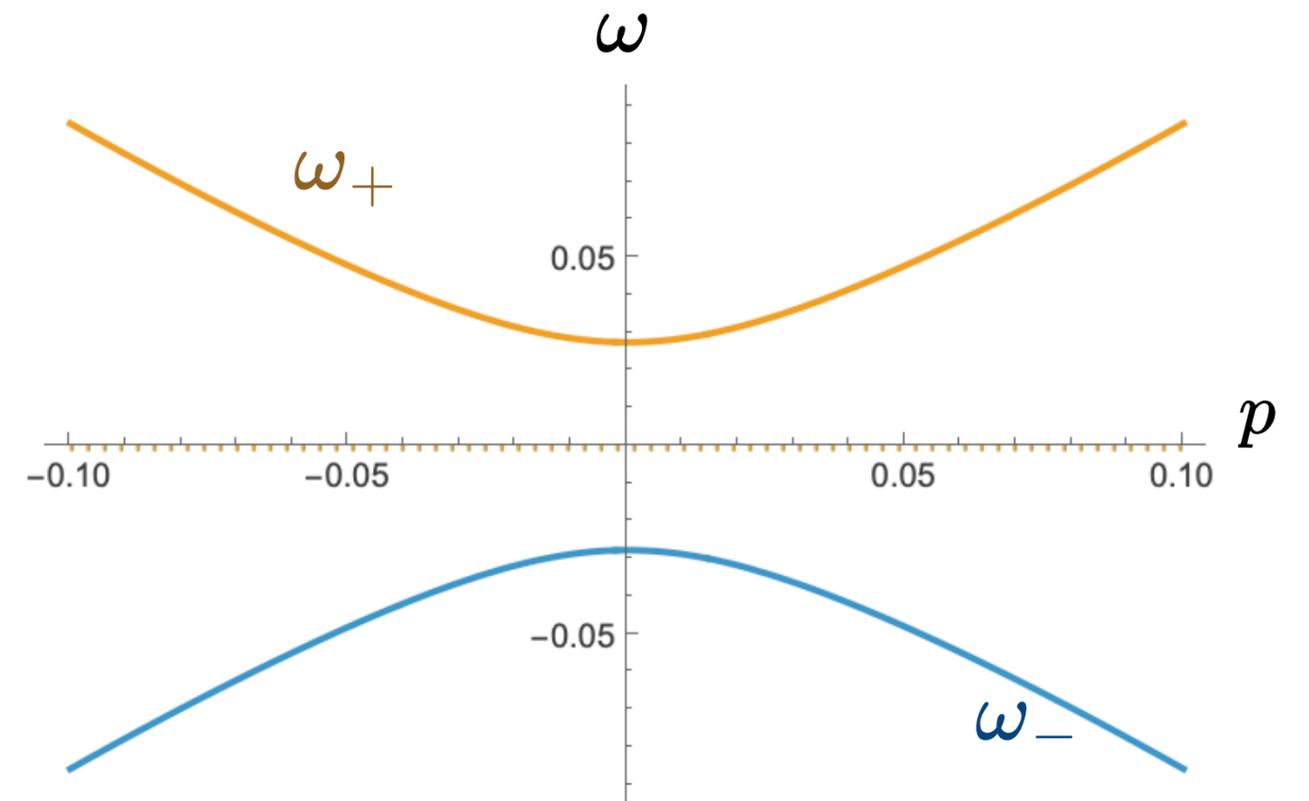

set angular momentum $m = 2$

Analytical Solution via WKB

plane wave ansatz: $u(t, \mathbf{r}) = e^{-i(\omega t - m\theta)} A(r) e^{i \int p dr}$

set angular momentum $m = 2$

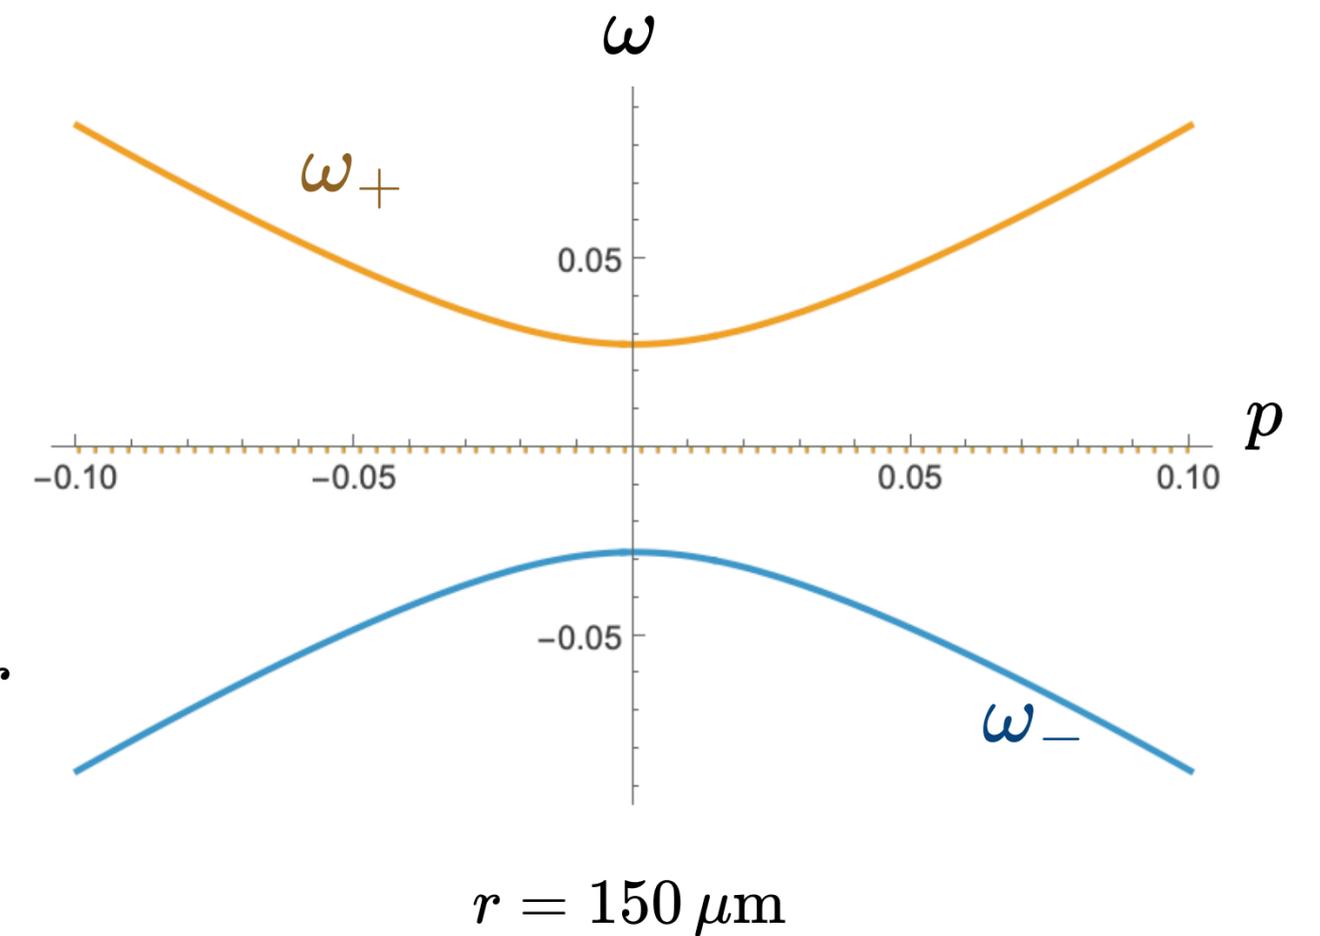

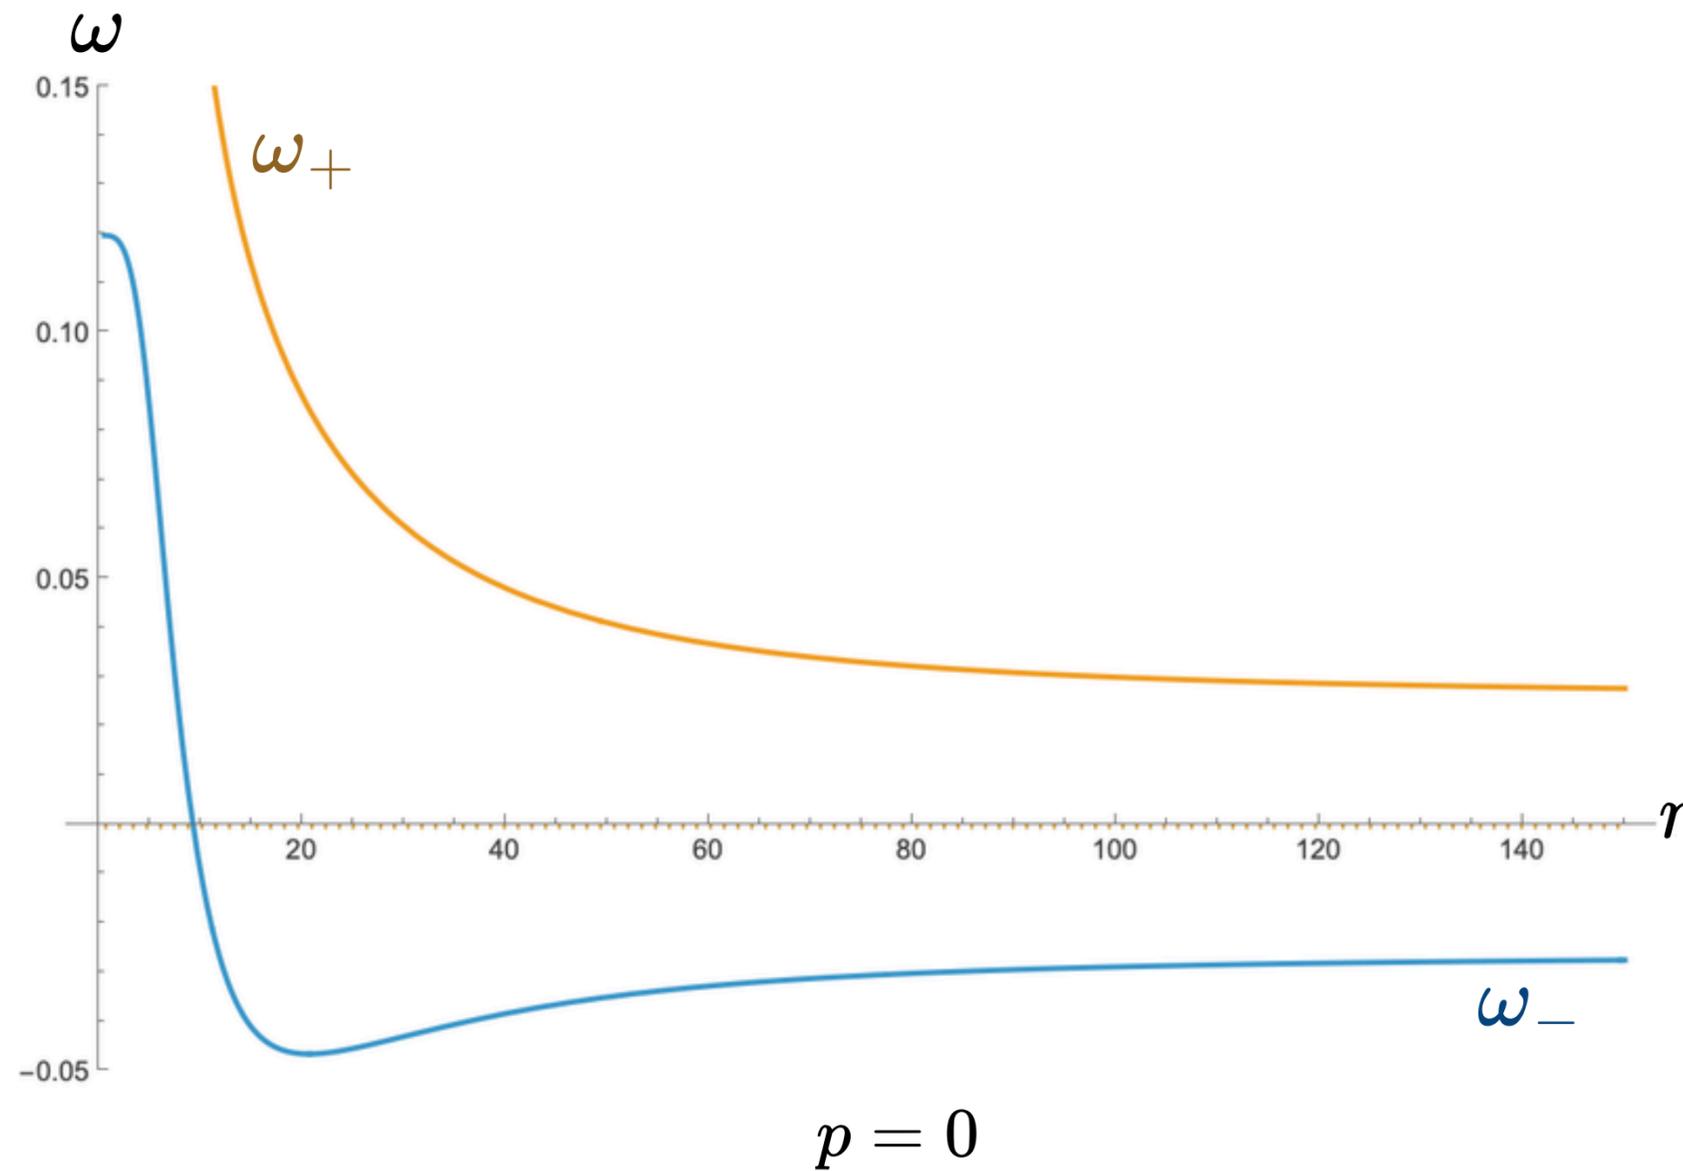

$$r = 150 \mu\text{m}$$

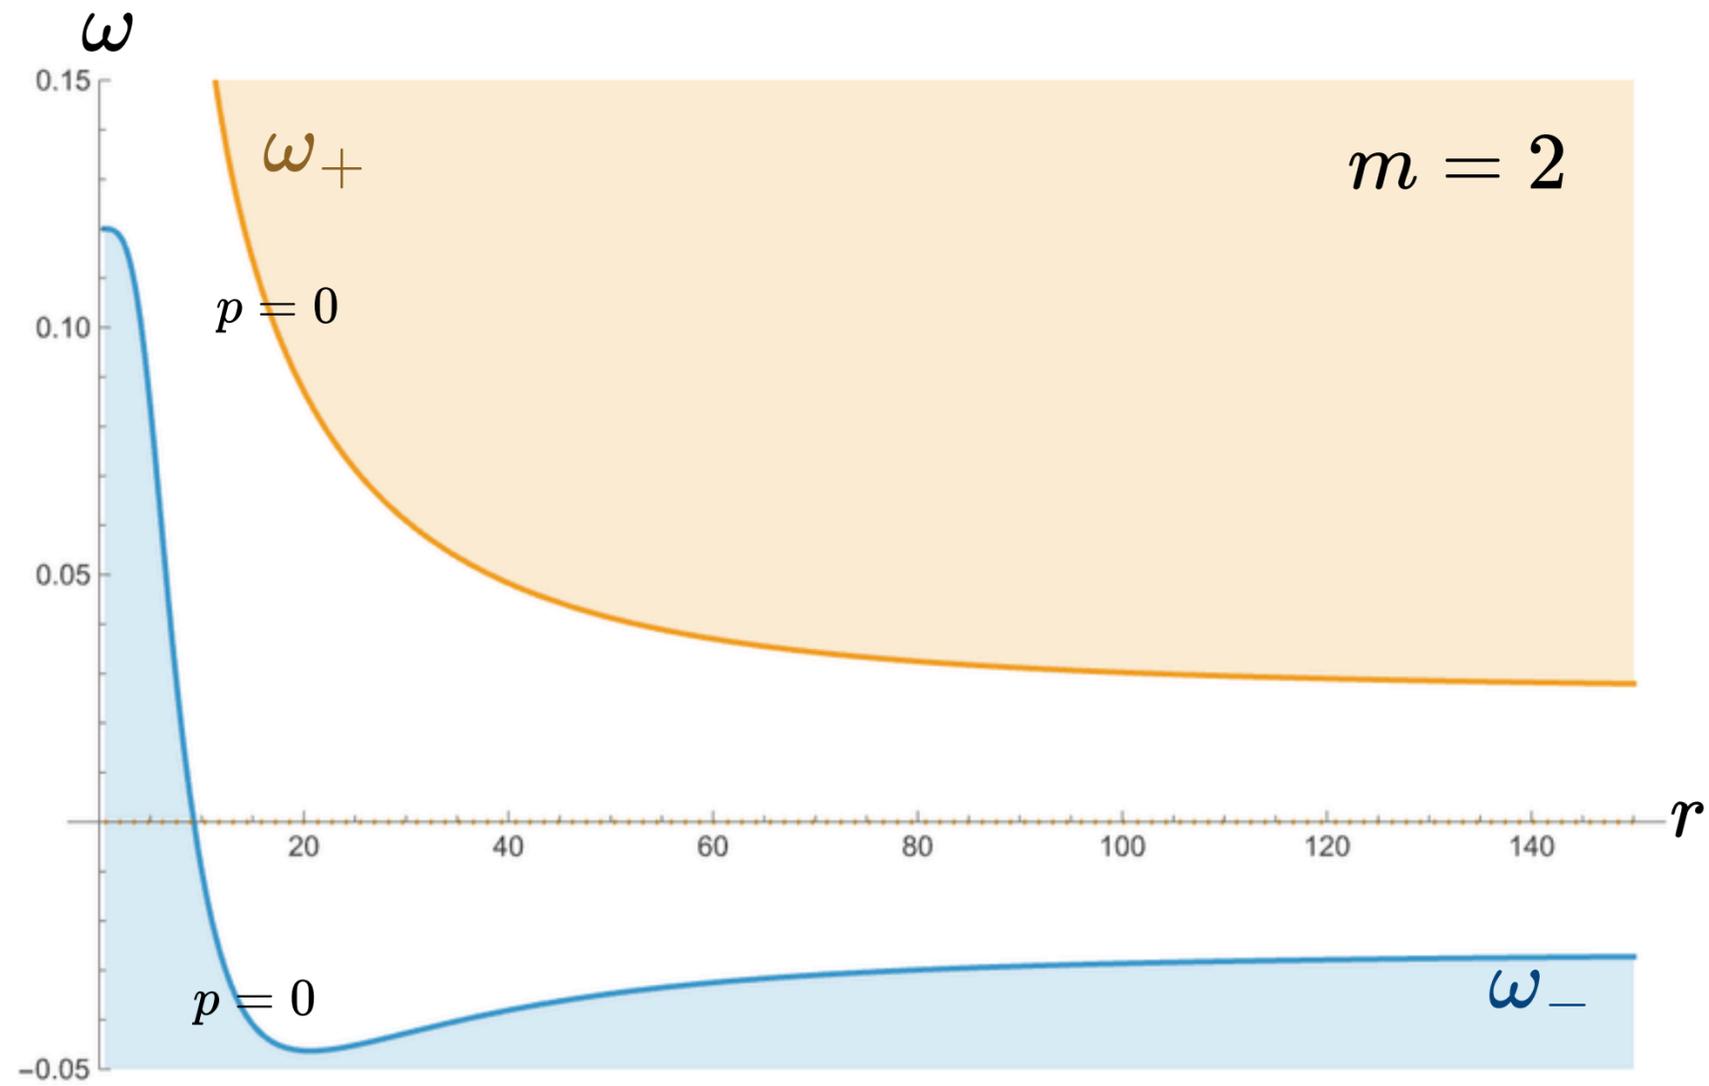

Analytical Solution via WKB

plane wave ansatz: $u(t, \mathbf{r}) = e^{-i(\omega t - m\theta)} A(r) e^{i \int p dr}$

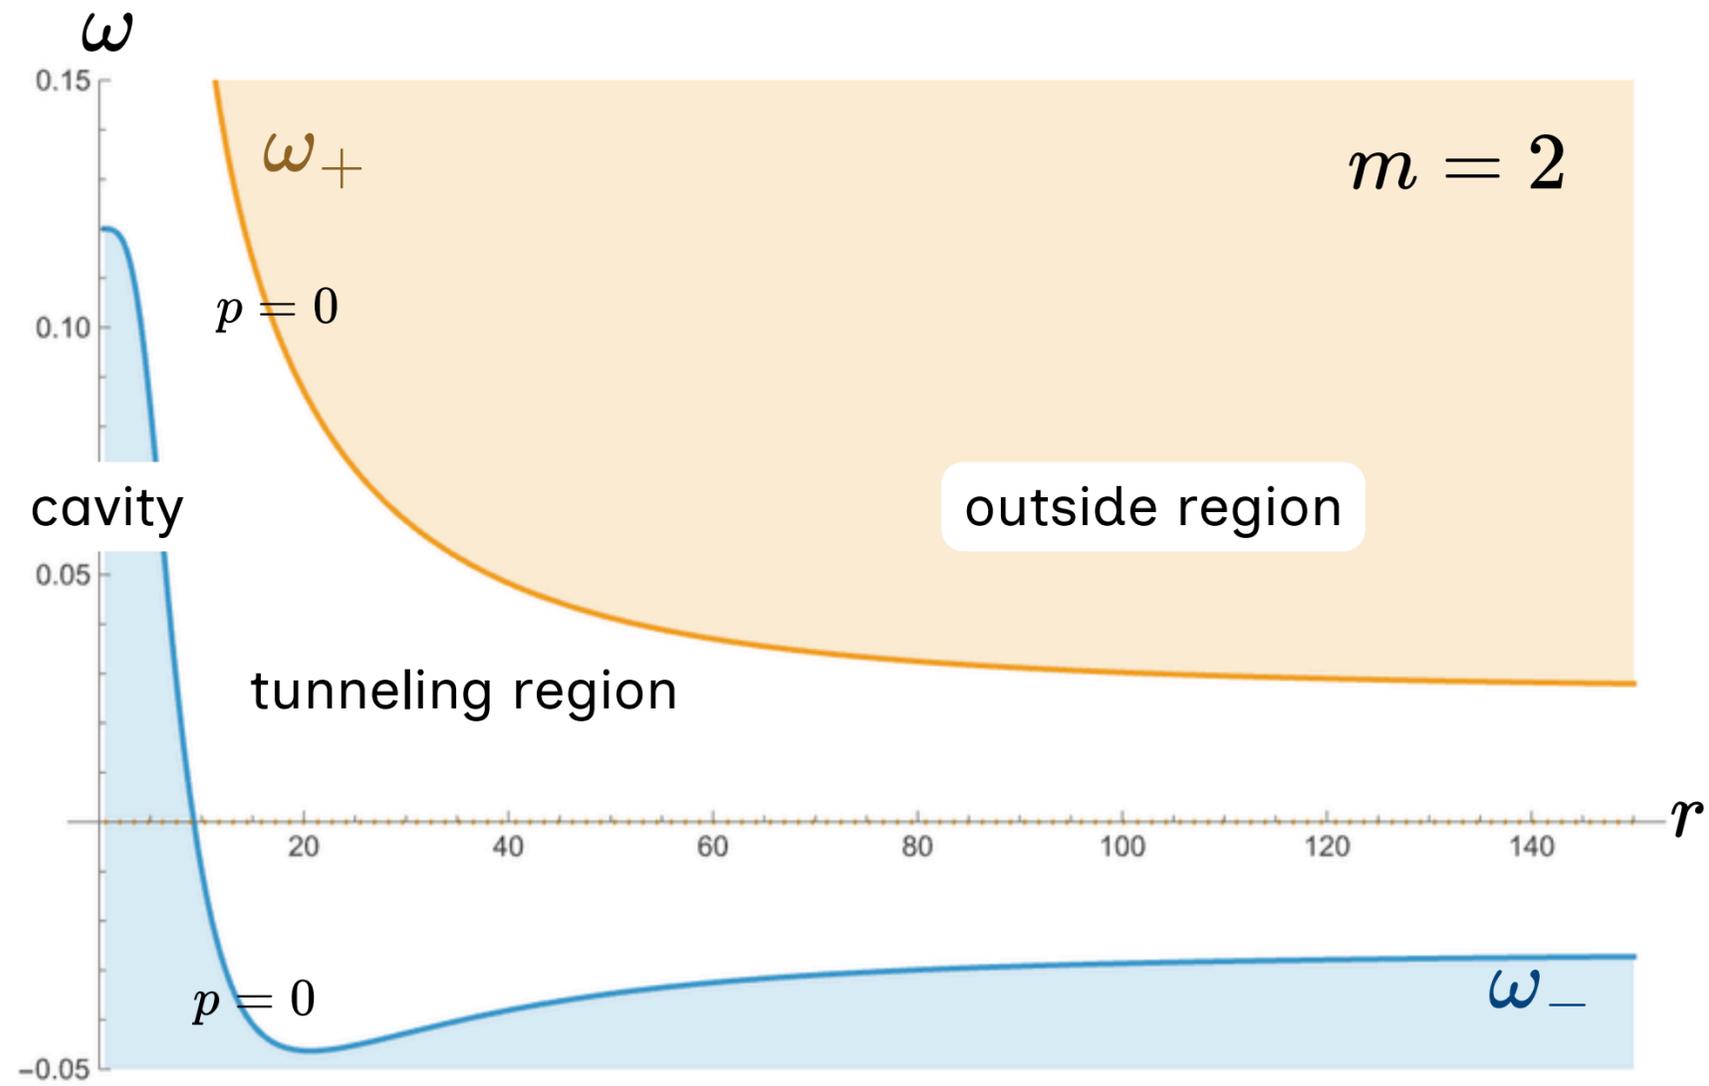

set angular momentum $m = 2$

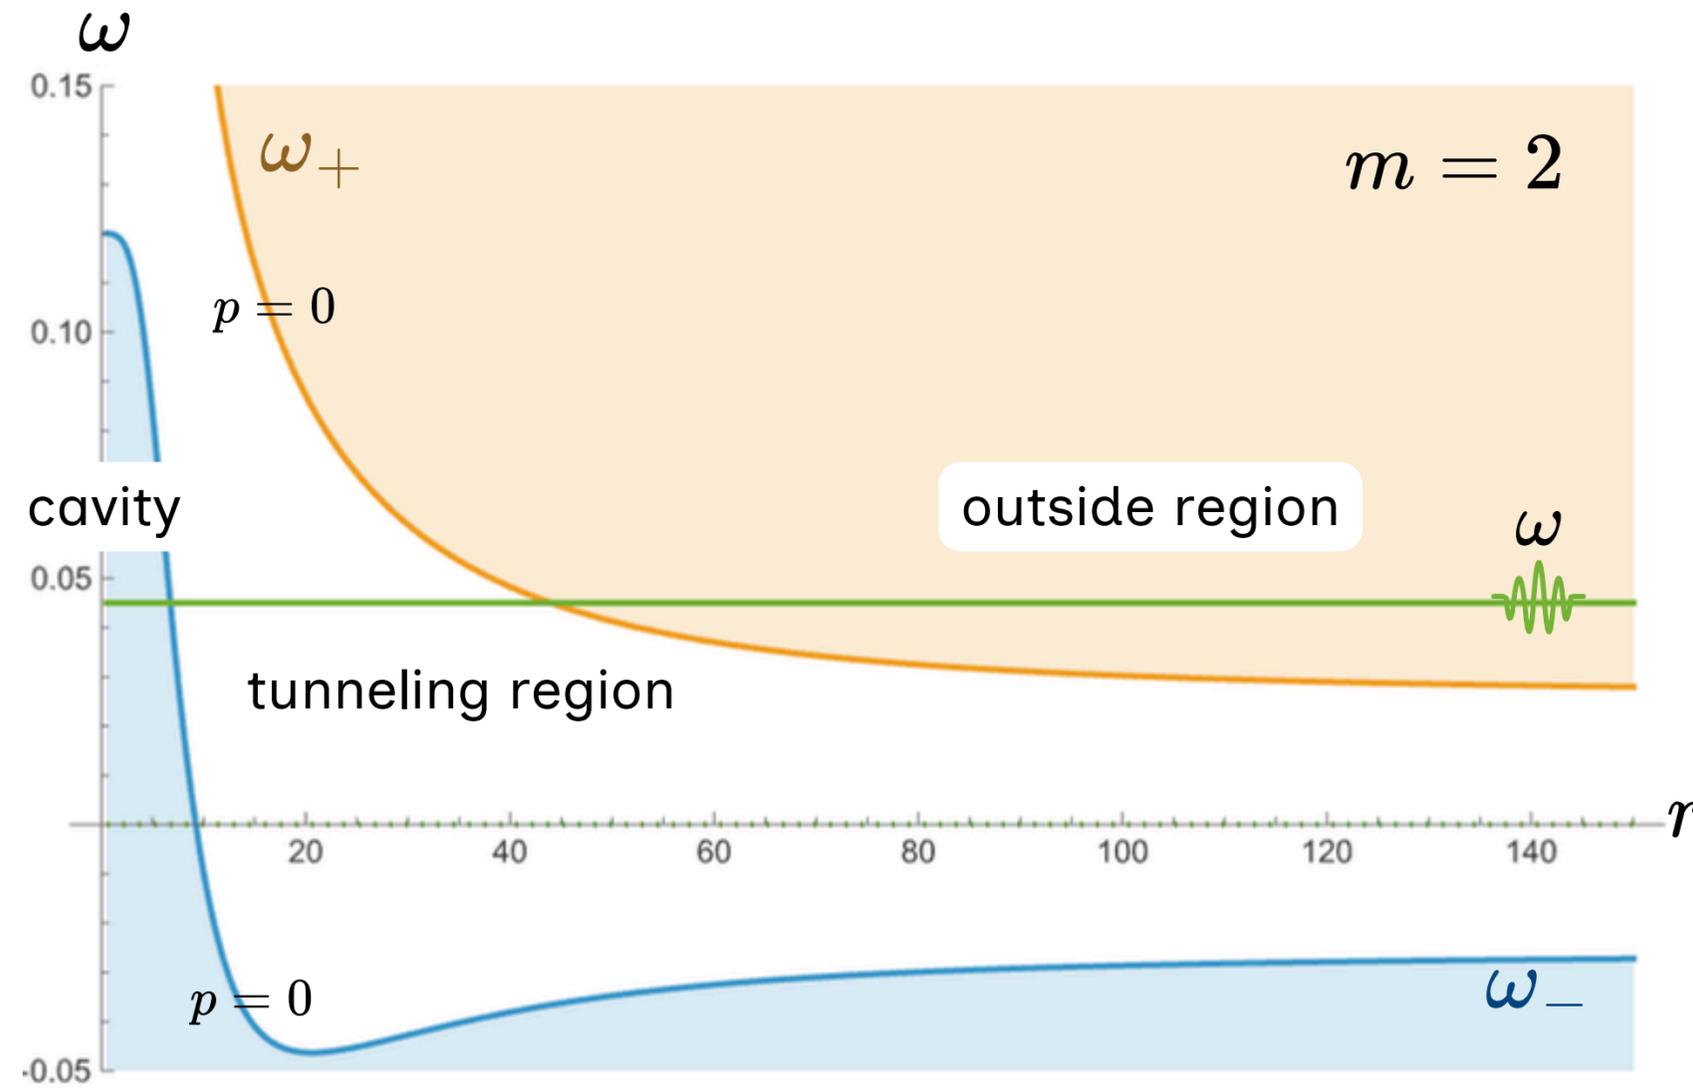

Analytical Solution via WKB

Analytical Solution via WKB

Analytical Solution via WKB

Resonant Frequency (without losses shift)

$$\hbar\left(\omega - \frac{i\gamma}{2}\right) \begin{pmatrix} u \\ v \end{pmatrix} = \mathcal{L}_{\text{BdG}} \begin{pmatrix} u \\ v \end{pmatrix}$$

resonant (cavity) frequency $\omega = \omega_r + i\Gamma$

	WKB Analysis
ω_r	0.0410 ps^{-1}
Γ	$7.18 \times 10^{-6} \text{ ps}^{-1}$

Resonant Frequency (without losses shift)

$$\hbar\left(\omega - \frac{i\gamma}{2}\right) \begin{pmatrix} u \\ v \end{pmatrix} = \mathcal{L}_{\text{BdG}} \begin{pmatrix} u \\ v \end{pmatrix}$$

resonant (cavity) frequency $\omega = \omega_r + i\Gamma$

	WKB Analysis	Diagonalization
ω_r	0.0410 ps ⁻¹	0.0458 ps ⁻¹
Γ	7.18×10^{-6} ps ⁻¹	1.014×10^{-5} ps ⁻¹

**Time Propagation of Wavepackets
Numerical Solutions**

Wavepacket Propagation (no losses)

$$i\hbar \frac{d}{dt} \begin{pmatrix} \psi \\ \psi^* \end{pmatrix} = \mathcal{L}_{\text{BdG}} \begin{pmatrix} \psi \\ \psi^* \end{pmatrix}$$

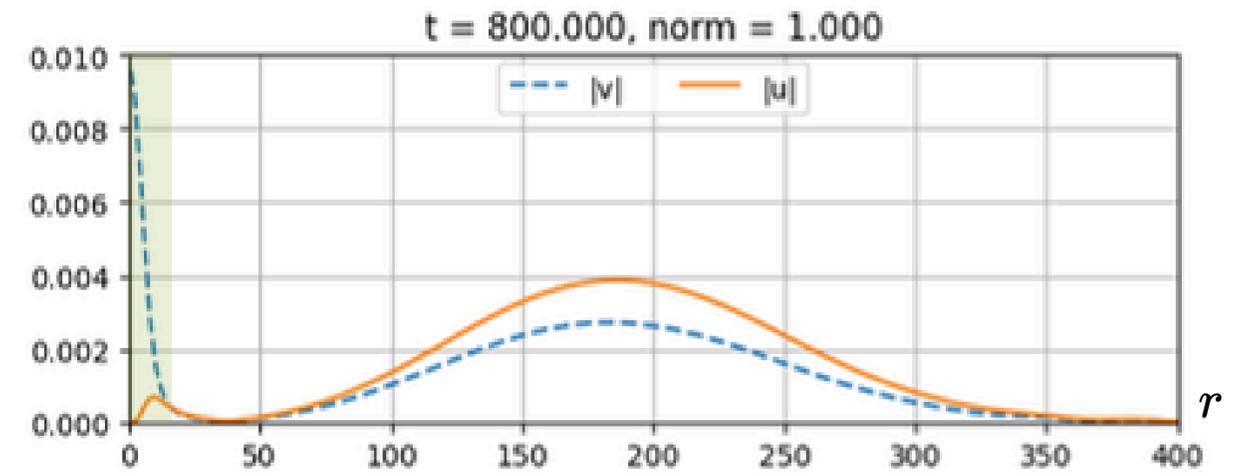

$$N = 2\pi \int (|u|^2 - |v|^2) r dr$$

Analysis of $v(t)$ in the Cavity Over Time

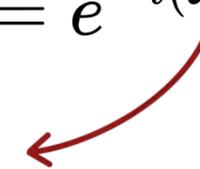

plane wave ansatz: $v(t, \mathbf{r}) = e^{-i(\omega t - m\theta)} B(r) e^{i \int p dr}$

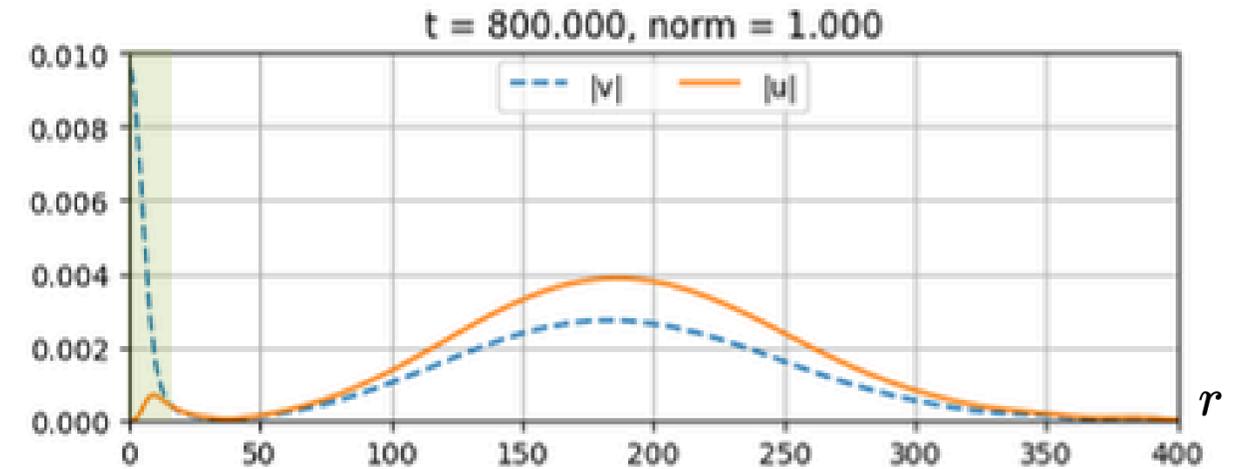

$$\omega = \omega_r + i\Gamma$$

Analysis of $v(t)$ in the Cavity Over Time

plane wave ansatz: $v(t, \mathbf{r}) = e^{-i(\omega t - m\theta)} B(r) e^{i \int p dr}$

$$\omega = \omega_r + i\Gamma$$

Fitting to cosine form at $r = 0.5 \mu\text{m}$

$$\text{Re}[v(t, r = 0.5)] = B e^{\Gamma t} \cos(\omega_r + \phi)$$

Analysis of $v(t)$ in the Cavity Over Time

plane wave ansatz: $v(t, \mathbf{r}) = e^{-i(\omega t - m\theta)} B(r) e^{i \int p dr}$

$$\omega = \omega_r + i\Gamma$$

Fitting to cosine form at $r = 0.5 \mu\text{m}$

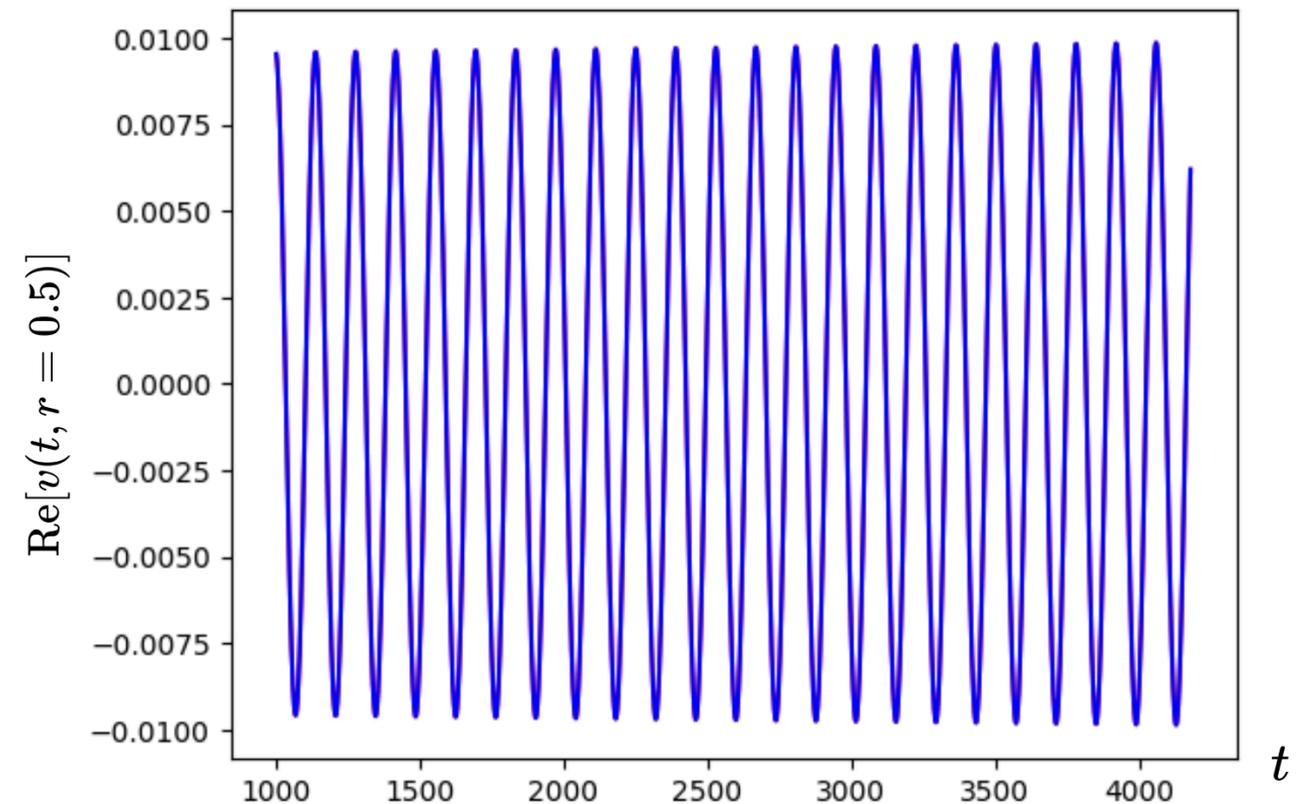

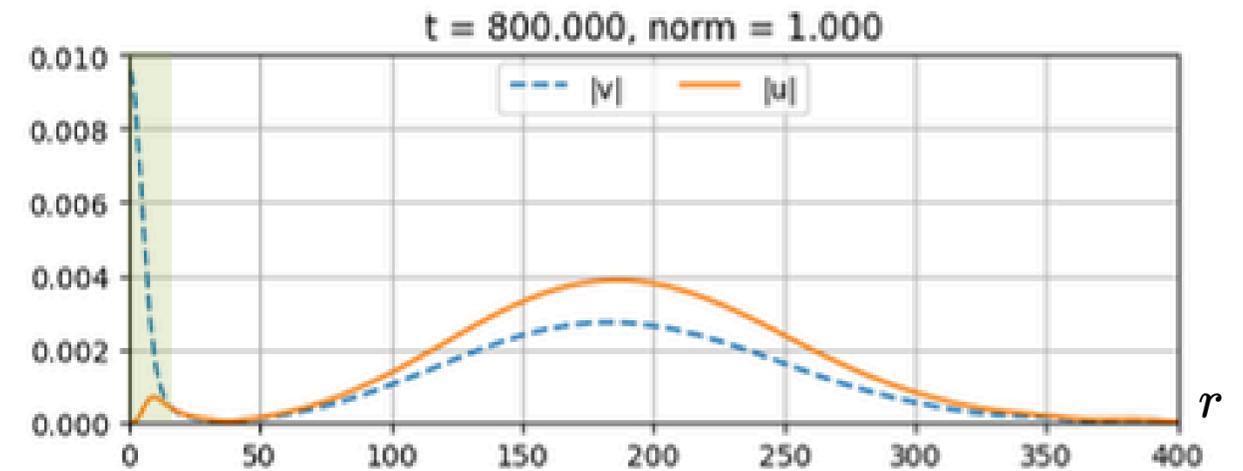

$$\text{Re}[v(t, r = 0.5)] = B e^{\Gamma t} \cos(\omega_r t + \phi)$$

$$B = -9.4916822810^{-3},$$

$$\Gamma = 9.3430354610^{-6},$$

$$\omega = 0.0451479720,$$

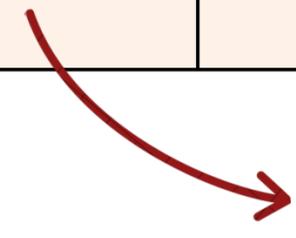

$$\phi = -0.168227685$$

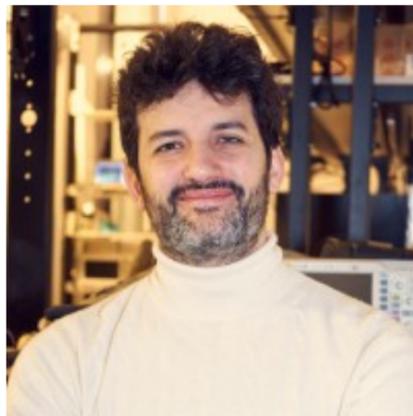

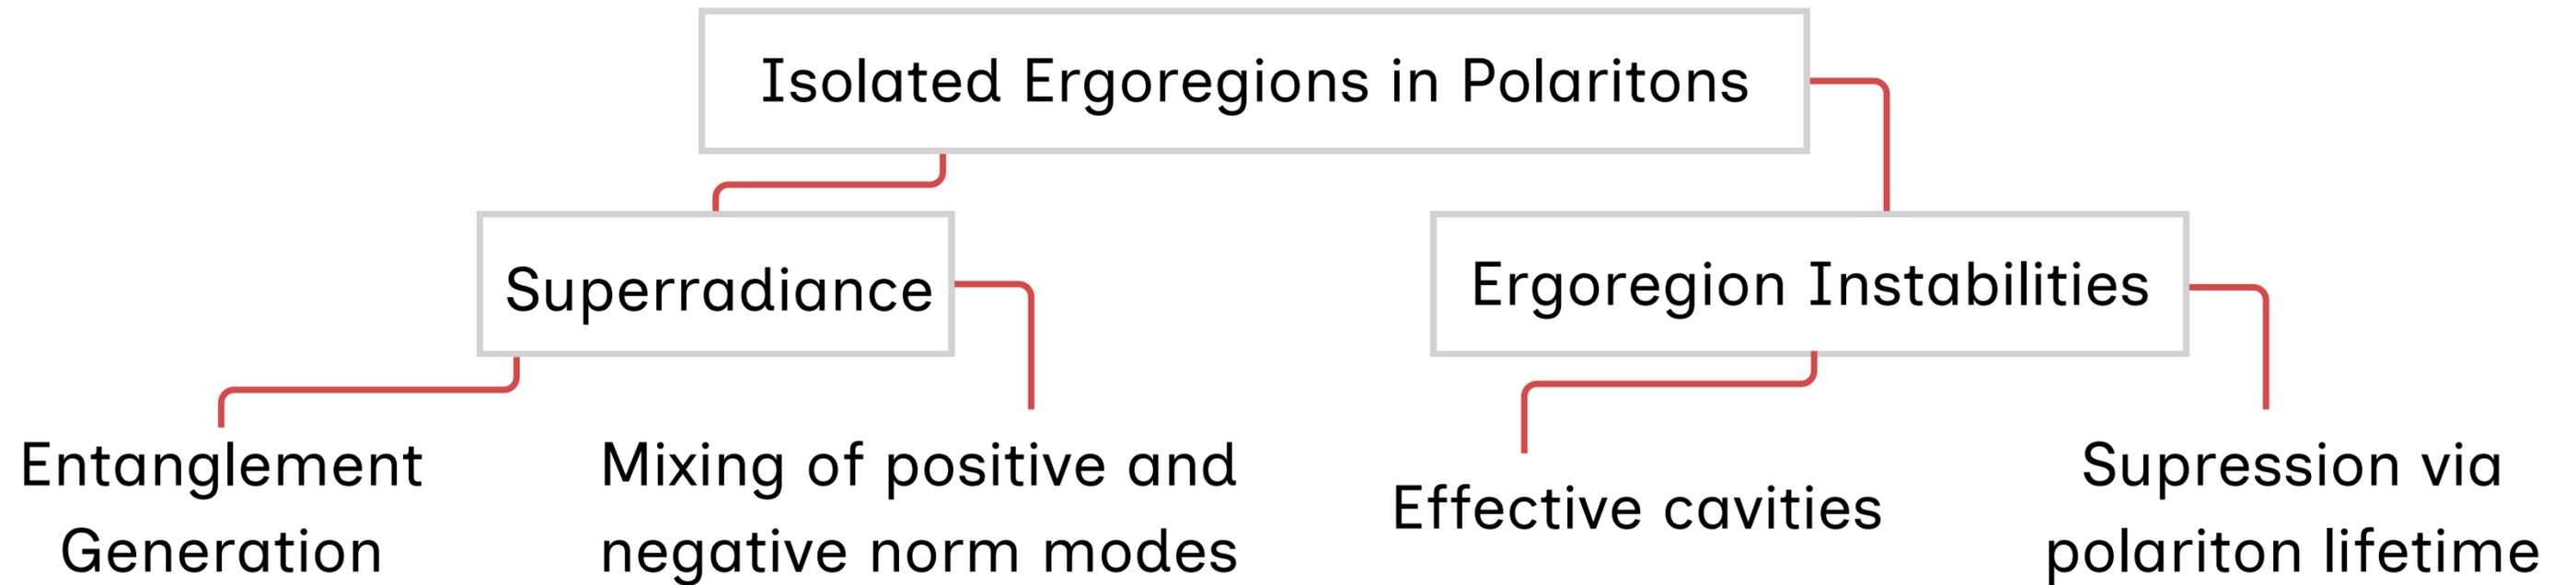

Resonant Frequency (without losses)

resonant (cavity) frequency $\omega = \omega_r + i\Gamma$

	WKB Analysis	Diagonalization	Time Propagation
ω_r	0.0410 ps^{-1}	0.0458 ps^{-1}	0.0451 ps^{-1}
Γ	$7.18 \times 10^{-6} \text{ ps}^{-1}$	$1.01 \times 10^{-5} \text{ ps}^{-1}$	$9.34 \times 10^{-6} \text{ ps}^{-1}$

 instability is suppressed by the losses $\Gamma \ll \gamma \sim 0.1 \text{ ps}^{-1}$
