

# qpe-toolbox: Tensor Network Simulation of Quantum Phase Estimation

Olivier Gauthé

Entanglement and topology in interacting quantum matter  
Benasque

February, 20th 2026

# Mandatory corporate slide

- ▶ Quobly is a quantum startup based in Grenoble, France
- ▶ building quantum computer
- ▶ semiconductor spin qubits technology
- ▶ Quantum information team:
  - ▶ simulation of (noisy) quantum hardware
  - ▶ simulation of quantum circuits
  - ▶ classical and quantum resources estimation

# Table of contents

- 1 Quantum computing in 2026
- 2 Quantum chemistry
- 3 Quantum Phase Estimation
- 4 `qpe-toolbox`: quantum phase estimation with tensor networks

- 1 Quantum computing in 2026
- 2 Quantum chemistry
- 3 Quantum Phase Estimation
- 4 qpe-toolbox: quantum phase estimation with tensor networks

## **NISQ: Noisy Intermediate-Scale Quantum**

- ▶ quantum hardware exists
- ▶ small number of qubits
- ▶ gate fidelity is limited
- ▶ noise is a major issue

## **FASQ: Fault-tolerant Application-Scale Quantum**

- ▶ large number of qubits
- ▶ quantum error correction suppresses noise
- ▶ deep circuits can be run

**Mind the gaps: The fraught road to quantum advantage**

Jens Eisert<sup>1,2,3</sup> and John Preskill<sup>4,5</sup>

# The Quest for a Quantum Advantage

Race between NISQ and classical simulations (non exhaustive)

Experiment	qubits	gates	Type	Simulated?	Useful?
Google 2019	53	430	Random circuit sampling	Yes (TN)	No
USTC 2023	50	?	Gaussian boson sampling	Yes (TN)	No
IBM 2023	127	2880	Ising model	Yes (TN, Pauli path)	Yes
Google 2025	65	1000	OTOC measurement	No	No

# Why Quantum Phase Estimation?

- ▶ There is a variety of quantum algorithms. We chose to focus on one
- ▶ The “zoo” of quantum algorithms breaks down into many variations of fewer algorithmic primitives
- ▶ We believe the first useful application of a QPU will require fault tolerant quantum computing (FTQC)
- ▶ QPE is:
  - ▶ a key subroutine in Shor’s algorithm
  - ▶ FTQC: requires deep circuits (hard to simulate classically)
  - ▶ expected to solve problems in chemistry, condensed matter

$$|j\rangle \rightarrow \frac{1}{\sqrt{2^n}} \sum_{k=0}^{2^n-1} e^{2\pi jk/2^n} |k\rangle$$

- ▶ Classical Fast Fourier Transform (FFT): cost  $\mathcal{O}(n2^n)$
- ▶ Quantum Fourier Transform:  $\mathcal{O}(n^2)$
- ▶ actually no quantum speed-up: MPS-based QFT simulated with cost  $\mathcal{O}(n)$

PRX QUANTUM 4, 040318 (2023)

---

## Quantum Fourier Transform Has Small Entanglement

Jielun Chen (陈捷伦)<sup>1,2,\*</sup> E.M. Stoudenmire<sup>3</sup> and Steven R. White<sup>1</sup>

- 1 Quantum computing in 2026
- 2 Quantum chemistry
- 3 Quantum Phase Estimation
- 4 qpe-toolbox: quantum phase estimation with tensor networks

- ▶  $N$  electrons,  $M$  molecular orbitals
- ▶ Molecular electronic Hamiltonian:

$$\hat{\mathcal{H}} = \hat{T}_{el} + \hat{V}_{nuc-el} + \hat{V}_{el-el} + \hat{V}_{nuc-nuc}$$

- ▶ Exact Diagonalization (FCI): exponential in  $M$
- ▶ Approximate methods: DFT for weakly correlated molecules
- ▶ strongly correlated molecules: tensor networks, quantum computers (?)

FeMocCO cluster  
of nitrogenase

# Effective Hamiltonian for quantum chemistry

- ▶ Born-Oppenheimer approximation: fixed ion positions
- ▶ chemistry basis set: sto-3g, 6-31g, ccpvdz...
- ▶ project on finite dimensional space
- ▶ Hartree-Fock to get molecular orbitals
- ▶ compute kinetic and Coulomb matrix elements

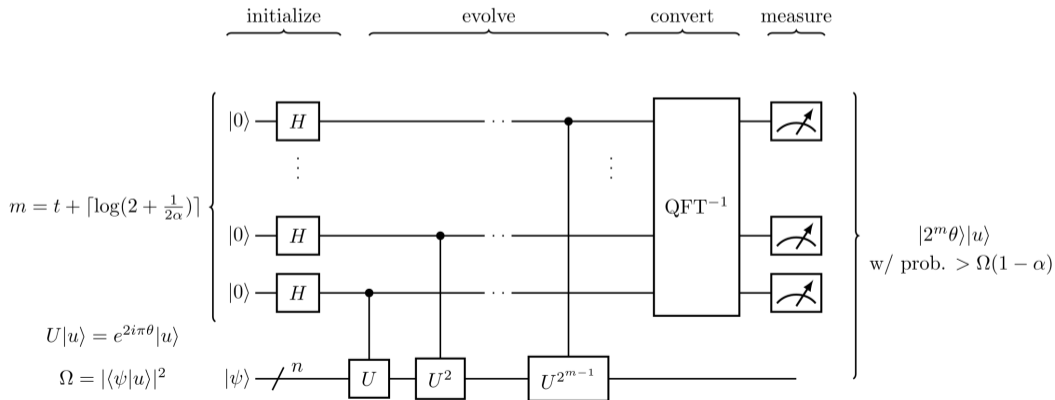

$$\hat{V}_{el-el} = \frac{1}{2} \sum_{p,q,r,s=1}^M V_{pqrs} \hat{c}_p^\dagger \hat{c}_p^\dagger \hat{c}_r \hat{c}_s$$

- ▶ TL;DR: Quantum chemistry is Fermi-Hubbard with long-range  $t$  and  $U$

- 1 Quantum computing in 2026
- 2 Quantum chemistry
- 3 Quantum Phase Estimation**
- 4 qpe-toolbox: quantum phase estimation with tensor networks

# Textbook Quantum Phase Estimation

- ▶  $U(t) = \exp(-iHt)$
- ▶ QPE finds eigenvalue with  $t$  bits precision
- ▶ initial state projected on eigenvector with probability  $\Omega = |\langle\psi|u\rangle|^2$

# Trotterized Quantum Phase Estimation

- ▶ cannot directly encode  $U(t) = \exp(iHt)$
- ▶ decompose  $H = \sum_k h_k$
- ▶ Trotter-Suzuki decomposition

$$U(\delta t) = \prod_k \exp(-ih_k \delta t) + O(\delta t^2)$$

- ▶ formulate each  $h_k$  as quantum gate
- ▶ control error with number of Trotter steps and time step length
- ▶ naïve implementation: cost  $\mathcal{O}(2^m (E_{\max} - E_{\min}) M^4)$   
 $m$  number of precision bits,  $M$  number of orbitals

# Progress in QPE resource use

Year	Innovation	FeMoco-54 [37]			FeMoco-76 [38]		
		Qubits	Toffolis	Reference	Qubits	Toffolis	Reference
2017	First resource estimate by Trotterization [37]	111	$5.0 \times 10^{13}$	[37]	-	-	-
2019	Qubitization of Single-Factorization [17]	3320	$9.5 \times 10^{10}$	[7]	3628	$1.2 \times 10^{11}$	[7]
2020	Qubitization of Double-Factorization (DF) [9]	3600	$2.3 \times 10^{10}$	[9]	6404	$5.3 \times 10^{10}$	[7]
2020	Tensor-Hyper-Contraction (THC) [7]	2142	$5.3 \times 10^9$	[7]	2196	$3.2 \times 10^{10}$	[7]
2024	Symmetry compression of DF [39]	1994	$2.6 \times 10^9$	[39]	-	-	-
2025	Symmetry compression of THC [8]	-	-	-	1512	$4.3 \times 10^9$	[8]
This work	Spectrum amplification & DFTHC	1137	$3.41 \times 10^8$		1459	$9.99 \times 10^8$	
Improvement of this work over [39] and [8] <sup>a</sup>		1.8×	7.0×		1.0 ×	4.3 ×

# Advanced QPE: Linear Combination of Unitaries

- ▶ Rewrite Hamiltonian as sum of unitaries

$$H = \sum_{\ell=0}^{L-1} w_{\ell} H_{\ell} \quad \text{s.t.} \quad w_{\ell} \geq 0, \quad H_{\ell}^2 = 1$$

- ▶ Define “one norm”  $\lambda \equiv \sum_{\ell=0}^{L-1} w_{\ell}$
- ▶ walk operator  $\mathcal{W} = \exp(-i \arccos(H/\lambda))$
- ▶ apply QPE on  $\mathcal{W}$
- ▶ cost  $\mathcal{O}(2^m C_{\mathcal{W}} \frac{\lambda}{\Omega})$

# Advanced QPE: Robust Phase Estimation

- ▶ single ancilla qubit / many repetitions of the circuit
- ▶ Inspired from J. Günther et al. arXiv:2503.05647
- ▶ Hadamard test: measure  $\langle U|\psi|U\rangle$  with  $U = \exp(-iHt)$  for  $t = 2^k, k = 1 \dots R$
- ▶ Find an estimate of  $2^k E \bmod 2\pi$  within measurement and Trotter error
- ▶ For each  $k$ , select the estimate closest to the previous one: improve precision on  $E$  by one bit
- ▶ Measure  $E$  up to  $\mathcal{O}(2^{-R})$  error with  $R$  circuits

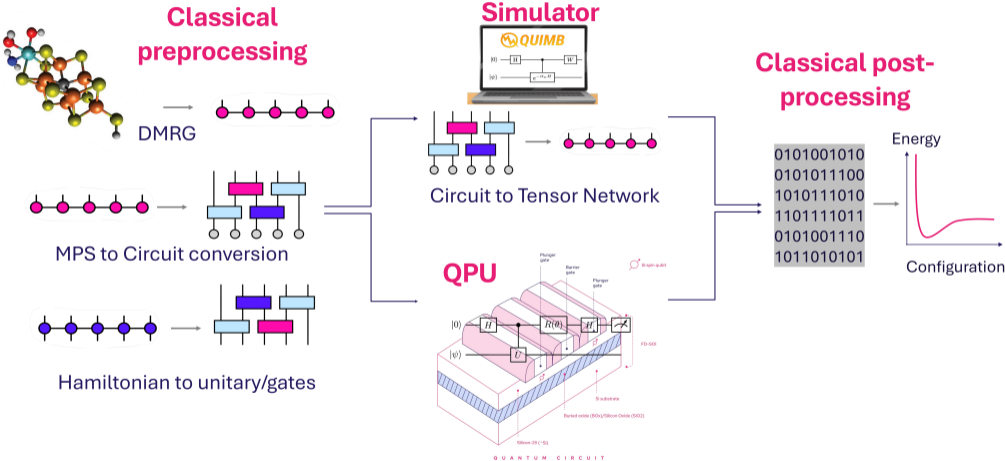

- 1 Quantum computing in 2026
- 2 Quantum chemistry
- 3 Quantum Phase Estimation
- 4 `qpe-toolbox`: quantum phase estimation with tensor networks

## Introducing `qpe-toolbox`

Objective: Simulate the full QPE pipeline. Get ready for QPE in the long term

Requirements	Features
Include the best classical algorithms	Component 1: Classical solution via DMRG
A classical-to-quantum converter	Component 2: Tensor-network state preparation
Advanced QPE schemes to reduce quantum resources	Component 3: qubitization, single-ancilla
Circuit simulations to quantify the boundary of a quantum advantage, prepare experiments	Component 4: Large-scale tensor network simulations and optimization

# qpe-toolbox in One Slide

- ▶ overview of tensor network possibilities for quantum circuit simulation
- ▶ benchmark: `quimb` vs `qiskit` for circuit simulation
- ▶ variational circuit optimization
- ▶ complete pipeline from quantum chemistry problem to QPE
- ▶ more to come in the future!

# Code is Available!

The screenshot shows a GitHub repository page for 'qpe-toolbox' by 'quobly-sw'. The repository is public and has 1 commit. The file list includes:

File Name	Commit	Time
.github/workflows	initial commit	yesterday
docs	initial commit	yesterday
examples	initial commit	yesterday
hooks	initial commit	yesterday
src/qpe_toolbox	initial commit	yesterday
tests	initial commit	yesterday
.gitignore	initial commit	yesterday
.pre-commit-config.yaml	initial commit	yesterday
CONTRIBUTING.md	initial commit	yesterday
LICENSE.txt	initial commit	yesterday
NOTICE.txt	initial commit	yesterday
README.md	initial commit	yesterday
pyproject.toml	initial commit	yesterday
uv.lock	initial commit	yesterday

The repository also includes a README, Contributing guide, and Apache-2.0 license. The 'About' section is currently empty. The 'Releases' section shows no published releases. The 'Packages' section shows no published packages. The 'Languages' section shows Python at 98.9% and Shell at 1.1%.

# Summary

- ▶ We develop an open-source numerical toolbox
  - ▶ Based on advanced tensor-network techniques
  - ▶ explore and evaluate performances of QPE variants
- ▶ First stage release “My pedagogical toolbox” (coming soon)
  - ▶ complete pipeline from quantum chemistry problem to QPE
  - ▶ Initialization: DMRG or circuit optimization
  - ▶ Hamiltonian encoding: Trotterization or naïve qubitization
  - ▶ Phase estimation: textbook QPE or Robust Phase Estimation
